(54) Title: THERAPEUTIC PEPTIDE-BASED CONSTRUCTS

(57) Abstract: The present invention relates generally to small peptide-based constructs, including derivatized constructs, and their therapeutic uses. The sequences of these constructs are based on a reverse subsequence derived from Domain II of bactericidal/permeability-increasing protein (BPI).

## THERAPEUTIC PEPTIDE-BASED CONSTRUCTS

This is a continuation-in-part of U.S. Application No. 09/344,219 and U.S. Application No. 09/344,827, each filed June 25, 1999, each hereby incorporated by reference in their entirety.

### FIELD OF THE INVENTION

The present invention relates generally to small peptide-based constructs that have 8 to 15 amino acid moieties, including derivatized constructs. The sequences of these constructs are designed and prepared based on a reverse subsequence (99-85) of amino acids identified and selected from Domain II of bactericidal/ permeability-increasing protein (BPI). The invention further relates to therapeutic uses of such constructs due to their heparin-related properties of heparin binding, heparin neutralization, inhibition of endothelial cell proliferation and/or inhibition of angiogenesis, *e.g.*, inhibition of *in vivo* neovascularization, including in models of chronic inflammatory disease states and metastatic tumors.

### BACKGROUND OF THE INVENTION

Bactericidal/permeability-increasing protein (BPI) is a protein isolated from the granules of mammalian polymorphonuclear neutrophils (PMNs), which are blood cells essential in defending a mammal against invading microorganisms. Human BPI has been isolated from PMNs by acid extraction combined with either ion exchange chromatography (Elsbach, 1979, *J. Biol. Chem.* 254: 11000) or *E. coli* affinity chromatography (Weiss *et al.*, 1987, *Blood* 69: 652), and has bactericidal activity against gram-negative bacteria. The molecular weight of human BPI is approximately 55,000 daltons (55kD). The amino acid sequence of the entire human BPI protein and the nucleic acid sequence of DNA encoding BPI, have been reported by Gray *et al.*, 1989, *J. Biol. Chem.* 264: 9505 (*see* Figure 1 in Gray *et al.*). The Gray *et al.* DNA and amino acid sequences are set out in SEQ ID NOS: 27 and 28 hereto.

The bactericidal effect of BPI was originally reported to be highly specific to sensitive gram-negative species. The precise mechanism by which BPI kills gram-negative bacteria is not yet known, but it is known that BPI must first attach to the surface of susceptible gram-negative bacteria. This initial binding of BPI to the

bacteria involves electrostatic interactions between BPI, which is a basic (*i.e.*, positively charged) protein, and negatively charged sites on lipopolysaccharides (LPS). LPS is also known as "endotoxin" because of the potent inflammatory response that it stimulates. LPS induces the release of mediators by host inflammatory 5 cells which may ultimately result in irreversible endotoxic shock. BPI binds to Lipid A, the most toxic and most biologically active component of LPS.

BPI is also capable of neutralizing the endotoxic properties of LPS to which it binds. Because of its gram-negative bactericidal properties and its ability to bind to and neutralize LPS, BPI can be utilized for the treatment of mammals suffering from 10 diseases and conditions initiated by infection with gram-negative bacteria whether the bacteria infect from outside the host or the bacteria infect from within the host (*i.e.*, gut-derived), including conditions of bacteremia, endotoxemia, and sepsis. These properties of BPI make BPI particularly useful and advantageous for such therapeutic administration.

15 A proteolytic fragment corresponding to the amino-terminal portion of human BPI possesses the LPS binding and neutralizing activities and antibacterial activity of BPI holoprotein. In contrast to the amino-terminal portion, the carboxyl-terminal region of isolated human BPI displays only slightly detectable antibacterial activity and some endotoxin neutralizing activity (Ooi *et al.*, 1991, *J. Exp. Med.* 174: 649).  
20 One BPI amino-terminal fragment, referred to as "rBPI<sub>23</sub>" (see Gazzano-Santoro *et al.*, 1992, *Infect. Immun.* 60: 4754-4761) has been produced by recombinant means as a 23kD protein and comprises an expression product of DNA encoding the first 199 amino acid residues of the human BPI holoprotein taken from Gray *et al.*, *supra*, except that valine at position 151 is specified by GTG rather than GTC and residue 25 185 is glutamic acid (specified by GAG) rather than lysine (specified by AAG). Recombinant holoprotein, also referred to as rBPI, has also been produced having the sequence set out in SEQ ID NOS: 27 and 28 taken from Gray *et al.*, *supra*, with the exceptions noted for rBPI<sub>23</sub>, as also shown in U.S. Patent No. 5,198,541. An N-terminal fragment analog designated rBPI<sub>21</sub> or rBPI<sub>21</sub>Δcys or rBPI (1-193) ala<sup>132</sup> 30 has been described in co-owned U.S. Patent No. 5,420,019 and corresponding International Publication No. WO 94/18323 (PCT/US94/01235), which are all incorporated herein by reference. This analog comprises the first 193 amino acids of BPI holoprotein as set out in SEQ ID NOS: 27 and 28 but wherein the cysteine at

residue number 132 is substituted with alanine, and with the exceptions noted for rBPI<sub>23</sub>. rBPI<sub>23</sub>, as well as the cysteine substitution analog designated rBPI<sub>21</sub>, have been introduced into human clinical trials. Proinflammatory responses to endotoxin were significantly ameliorated when rBPI<sub>23</sub> was administered in humans challenged 5 with endotoxin. (See, e.g., co-owned U.S. Patent Nos. 5,643,875 and 5,753,620 and corresponding International Publication No. WO 95/19784 (PCT/US95/01151), which are all incorporated herein by reference.) In addition, rBPI<sub>21</sub> was administered in humans with meningococcemia and hemorrhage due to trauma. (See; e.g., U.S. Patent 10 No. 5,888,977 and corresponding International Publication No. WO 97/42966 (PCT/US97/08016) and U.S. Patent No. 5,756,464 and corresponding International Publication No. WO 97/44056 (PCT/US97/08941), which are all incorporated herein by reference.)

Other endotoxin binding and neutralizing proteins and peptides are known in the art. One example is *Limulus* antilipopolysaccharide factor (LALF) from horseshoe 15 crab amebocytes (Warren *et al.*, 1992, *Infect. Immunol.* 60: 2506-2513). Another example is a cyclic, cationic lipopeptide from *Bacillus polymyxa*, termed Polymyxin B<sub>1</sub>. Polymyxin B<sub>1</sub> is composed of six α,γ-diaminobutyric acid residues, one D-phenylalanine, one leucine, one threonine and a 6-methyloctanoyl moiety (Morrison and Jacobs, 1976, *Immunochem.* 13: 813-818) and is also bactericidal. Polymyxin 20 analogues lacking the fatty acid moiety are also known, which analogues retain LPS binding capacity but are without appreciable bactericidal activity (Danner *et al.*, 1989, *Antimicrob. Agents Chemother.* 33: 1428-1434). Similar properties have also been found with synthetic cyclized polymyxin analogues (Rustici *et al.*, 1993, *Science* 259: 361-365).

Known antibacterial peptides include cecropins and magainins. The cecropins 25 are a family of antibacterial peptides found in the hemolymph of lepidopteran insects (Wade *et al.*, 1990, *Proc. Natl. Acad. Sci. USA* 87: 4761-4765), and the magainins are a family of antibacterial peptides found in *Xenopus* skin and gastric mucosa (Zasloff *et al.*, 1988, *Proc. Natl. Acad. Sci. USA* 85: 910-913). These peptides are linear and 30 range from about 20 to about 40 amino acids in length. A less active mammalian cecropin has been reported from porcine intestinal mucosa, cecropin P1 (Boman *et al.*, 1993, *Infect. Immun.* 61: 2978-2984). The cecropins are generally reported to be more potent than the magainins in bactericidal activity and appear to have less mammalian

cell cytotoxicity. The cecropins and magainins are characterized by a continuous, amphipathic  $\alpha$ -helical region which is necessary for bactericidal activity. The most potent of the cecropins identified to date is cecropin A. The sequence of the first ten amino acids of the cecropin A has some homology with the BPI amino acid sequence 5 90-99 but does not share the motif of charged and uncharged amino acids specified by the BPI amino acid sequence 90-99. In addition, the other 27 amino acids of cecropin A are necessary for maximal bactericidal activity and there is no homology with BPI for those 27 amino acids. The magainins have minimal homology with the BPI amino acid sequence 90-99.

10 Of interest to the present application are the disclosures in PCT International Application PCT/US91/05758 [WO 92/03535] relating to compositions comprising BPI and an anionic compound, which compositions are said to exhibit (1) no bactericidal activity and (2) endotoxin neutralizing activity. Anionic compounds are preferably a protein such as serum albumin but can also be a polysaccharide such as 15 heparin. In addition, Weiss *et al.*, 1975, *J. Clin. Invest.* 55: 33-42, disclose that heparin sulfate and LPS block expression of the permeability-increasing activity of BPI. However, neither reference discloses that BPI actually binds to and/or neutralizes the biologic activities of heparin. Heparin binding does not necessarily imply heparin neutralization. For example, a family of heparin binding growth factors 20 (HBGF) requires heparin as a cofactor to elicit a biological response. Examples of HBGF's include: fibroblast growth factors (FGF-1, FGF-2) and endothelial cell growth factors (ECGF-1, ECGF-2). Antithrombin III inhibition of clotting cascade proteases is another example of a heparin binding protein that requires heparin for activity and clearly does not neutralize heparin. Heparin binding proteins that do neutralize 25 heparin (*e.g.*, platelet factor IV, protamine, and thrombospondin) are generally inhibitory of the activities induced by heparin binding proteins that use heparin as a cofactor.

Of particular interest to the present application are the heparin-related activities 30 of BPI protein products. Specifically, BPI protein products have been shown to have heparin binding and heparin neutralization activities in co-assigned U.S. Patent Nos. 5,348,942; 5,639,727; 5,807,818; 5,837,678; 5,854,214 and corresponding International Publication No. WO 94/20128 (PCT/US94/02401), which are all incorporated herein by reference. For example, rBPI<sub>23</sub> was shown to have high

affinity for heparin (*see also*, Little *et al.*, 1994, *J. Biol. Chem.* 269: 1865-1872, and has been administered in humans to neutralize heparin (*see, e.g.* U.S. Patent No. 5,348,942, incorporated herein by reference). These heparin binding and neutralization activities of BPI protein products are significant due to the importance 5. of current clinical uses of heparin. Heparin is commonly administered in doses of up to 400 U/kg during surgical procedures such as cardiopulmonary bypass, cardiac catheterization and hemodialysis procedures in order to prevent blood coagulation during such procedures. When heparin is administered for anticoagulant effects during surgery, it is an important aspect of post-surgical therapy that the effects of 10 heparin are promptly neutralized so that normal coagulation function can be restored. Currently, protamine is used to neutralize heparin. Protamines are a class of simple, arginine-rich, strongly basic, low molecular weight proteins. Administered alone, protamines (usually in the form of protamine sulfate) have anti-coagulant effects. When administered in the presence of heparin, a stable complex is formed and the 15 anticoagulant activity of both drugs is lost. However, significant hypotensive and anaphylactoid effects of protamine have limited its clinical utility. Thus, due to its heparin binding and neutralization activities, BPI protein products have potential utility as a substitute for protamine in heparin neutralization in a clinical context without the deleterious side-effects which have limited the usefulness of the 20 protamines. The additional antibacterial and anti-endotoxin effects of such BPI protein products would also be useful and advantageous in post-surgical heparin neutralization compared with protamine.

Additionally of particular interest, is the activity of BPI protein products to inhibit angiogenesis due in part to their heparin binding and neutralization activities. 25 (See, *e.g.*, co-owned U.S. Patent Nos. 5,807,818 and 5,837,678 and corresponding International Publication No. WO 94/20128 (PCT/US94/02401), which are all incorporated herein by reference.) Angiogenesis, the growth of new blood vessels (neovascularization) is a complex phenomenon that involves growth factors, most of which have heparin as a co-factor. In adults, angiogenic growth factors are released as 30 a result of vascular trauma (wound healing), immune stimuli (autoimmune disease), inflammatory mediators (prostaglandins) or from tumor cells. These factors induce proliferation of endothelial cells (which is necessary for angiogenesis) *via* a heparin-dependent receptor binding mechanism (*see* Yayon *et al.*, 1991, *Cell* 64: 841-848).

Angiogenesis is also associated with a number of other pathological conditions, including the growth, proliferation, and metastasis of various tumors; diabetic retinopathy, macular degeneration, retrobulbar fibroplasia, neovascular glaucoma, psoriasis, angiofibromas, immune and non-immune inflammation including 5 rheumatoid arthritis, capillary proliferation within atherosclerotic plaques, hemangiomas, endometriosis and Kaposi's sarcoma. Thus, it would be desirable to inhibit angiogenesis in these and other instances, and the heparin binding and neutralization activities of BPI protein products, including peptides derived from or based on BPI, are useful to that end.

10 Heparin binding proteins fall into at least two classes. The first class consists of those proteins that utilize heparin as a co-factor in eliciting a specific response. These proteins include heparin-dependent growth factors (*e.g.*, basic fibroblast growth factor, acidic fibroblast growth factor and vascular endothelial cell growth factor) which play a major role in angiogenesis. The second class includes proteins that 15 neutralize the heparin-dependent response. BPI protein products, including peptides derived from BPI, have been identified as heparin neutralizing and anti-angiogenic agents. Several other heparin neutralizing proteins are also known to inhibit angiogenesis. For example, protamine is known to inhibit tumor-associated angiogenesis and subsequent tumor growth [*see* Folkman *et al.*, 1992, *Inflammation: Basic Principles and Clinical Correlates*, 2d ed., (Galin *et al.*, eds., Review Press, N.Y.), Ch. 40, pp. 821-839]. A second heparin neutralizing protein, platelet factor IV, also inhibits angiogenesis (*i.e.*, is angiostatic). Another known angiogenesis inhibitor, thrombospondin, binds to heparin with a repeating serine/tryptophan motif instead of a 20 basic amino acid motif (*see* Guo *et al.*, 1992, *J. Biol. Chem.* 267: 19349-19355).

25 Murine endostatin is also reported to bind heparin and inhibit angiogenesis (*see*, *e.g.*, Hohenester *et al.*, 1998, *Embo J.* 17: 1656-1664; O'Reilly *et al.*, 1997, *Cell* 88: 277-285).

Another utility of BPI protein products involves pathological conditions 30 associated with chronic inflammation, which is usually accompanied by angiogenesis (*see*, *e.g.*, co-owned U.S. Patent No. 5,639,727, incorporated herein by reference). One example of a human disease related to chronic inflammation is arthritis, which involves inflammation of peripheral joints. In rheumatoid arthritis, the inflammation is autoimmune, while in reactive arthritis, inflammation is hypothesized to be

associated with initial infection of the synovial tissue with pyogenic bacteria or other infectious agents followed by aseptic chronic inflammation in susceptible individuals. Folkman *et al.*, 1992, *supra*, have also noted that many types of arthritis progress from a stage dominated by an inflammatory infiltrate in the joint to a later stage in which a neovascular pannus invades the joint and begins to destroy cartilage. While it is unclear whether angiogenesis in arthritis is a causative component of the disease or an epiphomenon, there is evidence that angiogenesis is necessary for the maintenance of synovitis in rheumatoid arthritis. One known angiogenesis inhibitor, AGM1470, has been shown to prevent the onset of arthritis and to inhibit established arthritis in collagen-induced arthritis models (Peacock *et al.*, 1992, *J. Exp. Med.* 175: 1135-1138). While nonsteroidal anti-inflammatory drugs, corticosteroids and other therapies have provided treatment improvements for relief of arthritis, there remains a need in the art for more effective therapies for arthritis and other inflammatory diseases.

Many additional utilities of BPI protein products, including rBPI<sub>23</sub> and rBPI<sub>21</sub>, have been described due to the wide variety of biological activities of these products. For example, BPI protein products are bactericidal for gram-negative bacteria, as described in U.S. Patent Nos. 5,198,541 and 5,523,288, which are all incorporated herein by reference. International Publication No. WO 94/20130 (incorporated herein by reference) proposes methods for treating subjects suffering from an infection (e.g. gastrointestinal) with a species from the gram-negative bacterial genus *Helicobacter* with BPI protein products. BPI protein products also enhance the effectiveness of antibiotic therapy in gram-negative bacterial infections, as described in U.S. Patent No. 5,523,288 and International Publication No. WO 95/08344 (PCT/US94/11255), which are all incorporated herein by reference. BPI protein products are also bactericidal for gram-positive bacteria and mycoplasma, and enhance the effectiveness of antibiotics in gram-positive bacterial infections, as described in U.S. Patent Nos. 5,578,572; 5,783,561 and 6,054,431 and International Publication No. WO 95/19180 (PCT/US95/00656), which are all incorporated herein by reference. BPI protein products exhibit anti-fungal activity, and enhance the activity of other anti-fungal agents, as described in U.S. Patent No. 5,627,153 and International Publication No. WO 95/19179 (PCT/US95/00498), and further as described for anti-fungal peptides in U.S. Patent No. 5,858,974, which is in turn a continuation-in-part of U.S. Application No. 08/504,841 and

corresponding International Publication Nos. WO 96/08509 (PCT/US95/09262) and WO 97/04008 (PCT/US96/03845), which are all incorporated herein by reference. BPI protein products exhibit anti-protozoan activity, as described in U.S. Patent Nos. 5,646,114 and 6,013,629 and International Publication No. WO 96/01647 (PCT/US95/08624), which are all incorporated herein by reference. BPI protein products exhibit anti-chlamydial activity, as described in co-owned U.S. Patent No. 5,888,973 and WO 98/06415 (PCT/US97/13810), which are all incorporated herein by reference. Finally, BPI protein products exhibit anti-mycobacterial activity, as described in co-owned, co-pending U.S. Application No. 08/626,646, which is in turn a continuation of U.S. Application No. 08/285,803, which is in turn a continuation-in-part of U.S. Application No. 08/031,145 and corresponding International Publication No. WO 94/20129 (PCT/US94/02463), which are all incorporated herein by reference.

The effects of BPI protein products in humans with endotoxin in circulation, including effects on TNF, IL-6 and endotoxin are described in U.S. Patent Nos. 5,643,875; 5,573,620 and 5,952,302 and corresponding International Publication No. WO 95/19784 (PCT/US95/01151), which are all incorporated herein by reference.

BPI protein products are also useful for treatment of specific disease conditions, such as meningococcemia in humans (as described in co-owned U.S. Application No. 08/644,287 and U.S. Patent Nos. 5,888,977 and 5,990,086 and International Publication No. WO 97/42966 (PCT/US97/08016), hemorrhagic trauma in humans, (as described in U.S. Patent Nos. 5,756,464 and 5,945,399 and U.S. Application No. 09/293,107 and corresponding International Publication No. WO 97/44056 (PCT/US97/08941), burn injury (as described in U.S. Patent No. 5,494,896) ischemia/reperfusion injury (as described in U.S. Patent Nos. 5,578,568 and 6,017,881 and U.S. Application No. 09/416,828), and liver resection (as described in co-owned, co-pending U.S. Application No. 09/466,412 which is a continuation of U.S. Application No. 08/582,230, which is in turn a continuation of U.S. Application No. 08/318,357, which is in turn a continuation-in-part of U.S. Application No. 08/132,510, and corresponding International Publication No. WO 95/10297 (PCT/US94/11404), which are all incorporated herein by reference.

BPI protein products are also useful in antithrombotic methods, as described in U.S. Patent Nos. 5,741,779 and 5,935,930 and U.S. Application No. 09/299,319 and corresponding International Publication No. WO 97/42967 (PCT/US7/08017), which are all incorporated herein by reference.

5. There continues to exist a need in the art for new products that have one or more of the biological activities of BPI protein products, particularly products for use as heparin binding and neutralizing agents and for the inhibition of endothelial cell proliferation as well as inhibition of angiogenesis (normal or pathological). Advantageous therapeutic products that are peptide-based would ideally comprise  
10 small active sequences that are serum stable.

### SUMMARY OF THE INVENTION

This invention provides compounds and compositions of small peptide-based constructs that are optionally derivatized with a hydrophobic moiety and that  
15 are 8-15 amino acid moieties in length, having a sequence that is derived from or based on reverse subsequences identified and selected from functional domain II (amino acids 65-99) of BPI and having at least one of the heparin-related biological activities of BPI, such as heparin binding, heparin neutralization, inhibition of endothelial cell proliferation and/or inhibition of angiogenesis. A reverse (or retro)  
20 sequence is inverted from the original (e.g., if an original sequence is A-B-C, the inverted sequence is C-B-A). Sequences herein are written in the conventional way, *i.e.*, from the N-terminus to the C-terminus (left to right). Such peptide-based constructs, including derivatized constructs, according to the invention have reverse subsequences that consist of a minimum core sequence based on an amino acid  
25 motif derived from amino acids 99-92 of BPI. In a preferred embodiment the reverse subsequence is a substituted subsequence (for example, amino acids 99-92, 99-91, 99-90, 99-89, 99-88, 99-87, 99-86, or 99-85 wherein the substitutions are at 95 and 91). Additionally preferred is an 8-15 amino acid moiety sequence that has one or more D-amino acid moieties; in a most preferred sequence each or all of the  
30 amino acid moieties are D isomers.

Constructs (or compositions) according to the invention include those that are 8-15 moieties in length having at least one of the heparin-related biological activities of BPI, such as heparin binding, heparin neutralizing, endothelial cell

proliferation inhibiting, or antiangiogenic properties and comprise: (i) a sequence having the formula:  $\alpha-\chi-\chi-\alpha-\chi-\beta-\chi-\alpha-R$  or (ii) a derivatized sequence having the formula:  $R_1-\alpha-\chi-\chi-\alpha-\chi-\beta-\chi-\alpha-R$ .

R is a moiety that is any one of  $-\chi$ ,  $-\chi-\alpha$ ,  $-\chi-\alpha-\chi$ ,  $\chi-\alpha-\chi-\beta$ ,  $-\chi-\alpha-\chi-\beta-\chi$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha$ ,  $-\chi-\alpha-\chi-\chi-\alpha-\chi$ ,  $-\chi-\alpha-\chi-\chi-\alpha-\chi$ ,  $-NH_2$ ,  $-\chi-NH_2$ ,  $-\chi-\alpha-NH_2$ ,  $-\chi-\alpha-\chi-NH_2$ ,  $-\chi-\alpha-\chi-\beta-NH_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-NH_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha-NH_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha-\chi-NH_2$ , or  $-\chi-\alpha-\chi-\chi-\alpha-NH_2$ .

In the sequence (i) or (ii), and as used elsewhere herein,  $\alpha$  is a hydrophilic basic amino acid moiety that is any one of lysine, arginine, histidine, ornithine, diaminobutyric acid, citrulline, or para-amino phenylalanine;  $\beta$  is a hydrophilic neutral amino acid moiety that is any one of asparagine, glutamine, serine, threonine, tyrosine, hydroxyproline, or 7-hydroxy-tetrahydroisoquinoline carboxylic acid;  $\chi$  is a hydrophobic amino acid moiety that is any one of alanine, naphthylalanine, biphenylalanine, valine, leucine, isoleucine, proline, phenylalanine, tryptophan, methionine, glycine, cyclohexylalanine, amino-isobutyric acid, norvaline, norleucine, tert-leucine, tetrahydroisoquinoline carboxylic acid, pipecolic acid, phenylglycine, homophenylalanine, cyclohexylglycine, dehydroleucine, 2, 2-diethylglycine, 1-amino-1-cyclopentanecarboxylic acid, 1-amino-1-cyclohexanecarboxylic acid, amino-benzoic acid, amino-naphthoic acid,  $\gamma$ -aminobutyric acid, beta-alanine, difluorophenylalanine, fluorophenylalanine, nipecotic acid,  $\alpha$ -amino butyric acid, thienyl-alanine, or t-butylglycine.

$R_1$  is any one of  $R_2-CH_2-$ ,  $R_2-CH_2-CO-$ ,  $R_2-CO-$ ,  $R_2-SO_y-$ , or  $R_2-PO_z-$ ;

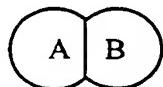

wherein,

$$y=0-3;$$

$$z=1-4;$$

$R_2$  is a hydrophobic moiety that is a cyclic molecule having at least 3 carbon atoms, a heterocyclic molecule having at least 3 atoms, a functionalized cyclic molecule having at least 3 carbon atoms, or a functionalized heterocyclic molecule having at least three atoms.

As used herein, R<sub>2</sub> is a hydrophobic moiety that is any one of (a) an optionally substituted carbocyclic ring, saturated or partially or fully unsaturated, containing 3 to 8, preferably 5 or 6, carbon atoms; (b) an optionally substituted heterocyclic ring, saturated or partially or fully unsaturated, containing 3 to 8, preferably 5 or 6, atoms, wherein at least one atom is a heteroatom that is any one of oxygen, nitrogen, or sulfur; or (c) an optionally substituted bicyclic ring

wherein the fused rings A and B, independently, are a 5- or 6-membered ring, saturated or partially or fully unsaturated, and comprise carbon atoms and 10 optionally one to three heteroatoms selected from oxygen, sulfur, or nitrogen; where there is more than one heteroatom, each may be the same or different.

As used herein, substituent R<sub>2</sub> can be a monocyclic or bicyclic ring, either a carbocycle or a heterocycle. Bicyclic R<sub>2</sub> groups can contain two aliphatic rings, two aromatic rings, or one aliphatic and one aromatic ring. Heterocycles contain at 15 least one, and up to three, atoms selected from the group consisting of oxygen, nitrogen, or sulfur; where there is more than one heteroatom, each heteroatom may be the same or different. An R<sub>2</sub> substituent can be aliphatic, saturated or partially or fully unsaturated (*i.e.*, cycloalkyl, cycloalkenyl, heterocycloalkyl, or heterocycloalkylenyl), or can be aromatic (*i.e.*, aryl or heteroaryl). The R<sub>2</sub> 20 substituent is optionally substituted with one to three moieties, for example, C<sub>1-6</sub>alkyl, halo, C<sub>1-6</sub>alkoxy, acetyl, hydroxy, or the like; where there is more than one heteroatom, each heteroatom may be the same or different.

As used herein and as commonly used in the art, the term "aryl" is defined as a monocyclic or bicyclic aromatic group, *e.g.*, phenyl or naphthyl, which can be 25 unsubstituted or substituted. Likewise, the term "heteroaryl" is defined herein as a monocyclic or bicyclic ring system containing one or two aromatic rings and at least one nitrogen, oxygen, or sulfur atom. Where there is more than one heteroatom, each heteroatom may be the same or different. The heteroaryl can be unsubstituted or substituted, for example, with one or more, in particular one to 30 three, substituents. Where there is more than one heteroatom, each heteroatom may

be the same or different. Examples of heteroaryl groups include thienyl, furyl, pyridyl, oxazolyl, quinolyl, isoquinolyl, indolyl, triazolyl, isothiazolyl, isoxazolyl, imidizolyl, benzothiazolyl, pyrazinyl, pyrimidinyl, thiazolyl, or thiadiazolyl.

As used herein and as commonly used in the art, the term "cycloalkyl" is defined as a cyclic C<sub>3</sub>-C<sub>8</sub> hydrocarbon group, e.g., cyclopropyl, cyclobutyl, cyclohexyl, or cyclopentyl. The term "heterocycloalkyl" is similarly defined, except the ring contains at least one, preferably one to three, heteroatoms. Where there is more than one heteroatom, each heteroatom may be the same or different. Nonlimiting examples of heterocycloalkyl rings include 1,3-dioxolane, 2-pyrazoline, pyrazolidine, pyrrolidine, a pyrroline, 2H-pyran, 4H-pyran, morpholine, thiomorpholine, piperidine, 1,4-dithiane, and 1,4-dioxane. The terms "cycloalkenyl" and "heterocycloalkenyl" are similarly defined, except the ring is unsaturated.

In exemplary embodiments, R<sub>2</sub> may be a hydrophobic moiety that is any one of biotin, 2-biphenylene, 2-anthraquinone, 2-benzofuran, 2-indole, 1-isoquinoline, hydroxyphenyl, 2-quinoline, 1-[3-(3,4-dihydroxycinnamoyl)-1,3,4,5-tetrahydroxycyclohexyl], 1-(3,5-dichloro-2-hydroxyphenyl), 1-(3,5-diido-2-hydroxyphenyl), 1-(3,5-dinitro-2-hydroxyphenyl), 1-(4-azido-2-hydroxyphenyl), 4-biphenyl, 2-biphenyl, 1-naphthyl, 2-naphthyl, 3-amino-2-naphthyl, 3-chloro-2-nitrophenyl, 3,4-dihydroxyphenyl, 3,4,5-trihydroxyphenyl, 2-chloro-3-nitrophenyl, 5-azido-2-nitrophenyl, 3-amino-2-pyrazyl, 2-benzyloxycarbonyl-ethyl, 2-thienyl, 2-(3,4-dihydroxyphenyl)ethylene, 5-bromo-3-indolemethylene, 2-(4-hydroxy-3-methoxyphenyl)ethylene, 2-(3-chlorophenyl)ethylene, 2-pyrazyl, 4-imidazolyl, 2-imino-1-imidazolidyl, pyridyl, 3-piperidyl, 4-piperidyl, fluorescein, 2-(4-amino-3,5,6-trichloro-pyridyl), 3-(2-chloro-6-fluorophenyl)-5-methylisoxazolyl, or 4-azido-phenyl.

The invention also provides a composition of 8-15 amino acid moieties consecutively linked by peptide bonds, said composition having one or more heparin binding properties and comprising: (i) a sequence having the formula KLFR (naph-A) QAR<sub>3</sub> or (ii) a derivatized sequence of the formula: R<sub>1</sub>KLFR(naph-A)QAR<sub>3</sub>,

where R<sub>1</sub> is as above; and

wherein R<sub>3</sub> is any one of K, K(naph-A), K(naph-A)K, K(naph-A)KG, K(naph-A)KGS, K(naph-A)KGSI, K(naph-A)KGSIK or K(naph-A)KGSIKI; wherein the carboxyl terminal group is amidated or nonamidated, and, optionally, comprising at least one conservative substitution of amino acid moieties. Preferably, the composition comprises two or more conservative substitutions of amino acid moieties.

The constructs or compositions of the invention, including derivatized constructs or compositions, preferably comprise constructs or compositions wherein 10 the first two amino-terminal amino acid moieties are D-amino acid moieties and the last two carboxy-terminal amino acid moieties are D-amino acid moieties.

Also provided are methods of neutralizing heparin in a mammal that has been administered an exogenous heparin compound (including heparin or heparinoid substances, such as low molecular weight heparins) comprising the step 15 of administering to said mammal an amount of the composition of the invention effective to neutralize the anticoagulant effect of the exogenous heparin compound, preferably in an amount effective to return the clotting time of said mammal to normal; methods of inhibiting endothelial cell proliferation in a mammal in need thereof by administering to said mammal an amount of the compositions of the 20 invention effective to inhibit endothelial cell proliferation; methods of inhibiting angiogenesis in a mammal in need thereof by administering to said mammal an amount of such compositions effective to inhibit angiogenesis, including angiogenesis in the eye; methods of treating a mammal suffering from a disorder involving angiogenesis, including a chronic inflammatory disease, such as 25 rheumatoid or reactive arthritis, and including the growth, proliferation or metastasis of tumor cells.

Additional properties or activities of such constructs or compositions, including those derivatized according to the invention may include LPS binding, LPS neutralization, and/or antimicrobial activity and/or any other previously known 30 activity or property of BPI protein products. Although three functional domains of BPI were previously reported and include: domain I, encompassing the amino acid sequence of BPI from about amino acid 17 to about amino acid 45; domain II, encompassing the amino acid sequence of BPI from about amino acid 65 to about

amino acid 99; and domain III, encompassing the amino acid sequence of BPI from about amino acid 142 to about amino acid 169, biologically active reverse (or retro) sequences have not been previously reported based on subsequences of domain II. Thus, such peptide-based reverse (retro) sequence constructs according to the 5 invention, which preferably comprise selected D-amino acid moieties, are particularly useful as therapeutic agents.

Another aspect of the invention provides methods for identifying a derivatized peptide sequence derived from or based on the sequence identified and selected from Domain II of bactericidal/permeability-increasing protein (BPI) 10 having biological activity and epithelial absorption of at least 0.001% comprising the steps of:

(a) derivatizing a peptide sequence based on a sequence, subsequence, reverse sequence or reverse subsequence of Domain II of BPI through covalent linkage of a hydrophobic moiety or moieties at the N-terminus, C-terminus or 15 within said peptide sequence;

(b) measuring the activity of said derivatized peptide sequence obtained in step (a) wherein the activity is any one or more of heparin binding, heparin neutralizing, endothelial cell proliferation inhibiting, or antiangiogenic; and

(c) measuring the epithelial absorption of said derivatized peptide 20 sequence obtained in step (a).

Peptide sequences particularly suitable for derivatization in step (a) are peptides of minimal length necessary to retain biological activity (e.g. 8 to 15 amino acid moieties).

Such methods include a method for designing and identifying a biologically 25 active derivatized peptide-based sequence, prophylactic or therapeutic medicament derived from or based on the peptide sequence identified and selected from BPI or a fragment thereof with epithelial absorption of at least 0.001%, said method comprising the steps of:

(a) identifying a target peptide sequence derived from or based on the 30 polypeptide sequence of BPI or a fragment thereof which exhibits activity *in vitro* or *in vivo* wherein the activity is any one or more of heparin binding, heparin neutralizing, endothelial cell proliferation inhibiting, or antiangiogenic;

- (b) constructing a library of minimum length, activity retaining peptide sequences (MinLARPS) by substituting or deleting amino acid moieties within said target peptide sequence;
- 5 (c) measuring the activity of said MinLARPS to determine the minimum number of residues necessary to retain activity of at least 1% of that of said target polypeptide sequence wherein the activity is any one or more of heparin binding, heparin neutralizing, endothelial cell proliferation inhibiting, or antiangiogenic;
- 10 (d) measuring epithelial absorption of said MinLARPS in *in vivo* or *in vitro* assays to identify which of said MinLARPS retain epithelial absorption of at least 0.001%;
- 15 (e) synthesizing derivatized MinLARPS by chemically modifying said MinLARPS through covalent linkage of a hydrophobic moiety or moieties linked at the N-terminus, C-terminus, or within the sequence of said MinLARPS;
- (f) repeating steps (c) and (d) with said derivatized MinLARPS.

Further aspects of the invention include a construct or composition of the invention (including those derivatized according to the invention) for use in therapy, as well as the use of such a construct or composition for the manufacture of a medicament for binding an exogenous or therapeutically administered heparin compound, or for treating a heparin-related or heparin-mediated condition or disease.

Also contemplated by the present invention is a pharmaceutical composition comprising a construct or composition of the present invention, and a pharmaceutically acceptable adjuvant, diluent or carrier.

25

#### DETAILED DESCRIPTION

The present invention provides biologically active novel compounds (or compositions) that are 8 to 15 amino acid moieties in length, having a sequence that is derived from or based on a reverse subsequence identified and selected from 30 functional domain II of BPI. Constructs include non-derivatized sequences as well as sequences that are derivatized by covalent linkage of a hydrophobic moiety. Preferred are constructs with sequences that contain D-amino acid moieties. Particularly preferred are constructs with sequences where the D-amino acid moieties are

positioned as the first two amino-terminal and last two carboxy-terminal moieties of the sequence. Such constructs are particularly useful for the treatment of heparin-related or heparin-mediated disorders, diseases or conditions. "Treatment" as used herein encompasses both prophylactic and therapeutic treatment. Treatment of 5 mammals, including humans, is contemplated.

As used herein, "amino acid moiety" includes typical and atypical amino acid compounds (including derivatized amino acids and amino acid analogs). "Conservative" substitutions of one amino acid for another are substitutions of amino acids having similar structural and/or chemical properties, and are generally based on 10 similarities in polarity, charge, hydrophobicity, hydrophilicity and/or the amphipathic nature of the residues involved. Hydrophobic, polar neutral and polar basic amino acids include those described above for  $\alpha$ ,  $\beta$  and  $\gamma$ . Polar acidic amino acids include aspartic acid and glutamic acid. As a general rule, as the similarity between the amino acids being substituted decreases, the likelihood that the substitution will affect 15 activity increases.

For the purposes of this invention, the term "functional domain" is intended to designate a region of the amino acid sequence of BPI that exhibits one or more of the biological activities of BPI. These functional domains of BPI were defined by the activities of proteolytic cleavage fragments, overlapping 15-mer peptides and other 20 synthetic peptides. Domain I has been defined as the amino acid sequence of BPI comprising from about amino acid 17 to about amino acid 45. Initial peptides based on this domain were moderately active in both the inhibition of LPS-induced LAL activity and in heparin binding assays, and did not exhibit significant antibacterial activity. Domain II has been defined as the amino acid sequence of BPI comprising 25 from about amino acid 65 to about amino acid 99. Initial peptides based on this domain exhibited high LPS and heparin binding capacity and exhibited significant antibacterial activity. Domain III has been defined as the amino acid sequence of BPI comprising from about amino acid 142 to about amino acid 169. Initial peptides based on this domain exhibited high LPS and heparin binding activity, and exhibited 30 surprising antimicrobial activity, including antifungal and antibacterial (including, e.g., anti-gram-positive and anti-gram-negative) activity.

For the purposes of this invention, the term "biological activity of BPI" is intended to include, but is not limited to one or more of the biological activities or

properties of a human bactericidal/permeability-increasing (BPI) protein product, including, for example, a recombinant BPI holoprotein such as rBPI (SEQ ID NO: 28), an amino-terminal fragment of BPI such as rBPI<sub>23</sub>, and analogs that are mutated amino-terminal fragments of BPI such as rBPI<sub>21</sub>Δcys or rBPI (10-193) C132A (also 5 designated rBPI (10-193) ala<sup>132</sup>) and including any one or more of the known activities of the BPI protein products discussed above. Specifically included is a biological activity of any peptide-based construct of this invention that is between 0.1 and 10 times the activity of BPI or of a corresponding peptide encompassing a corresponding functional domain of BPI. The term "biological activity of BPI" is 10 intended to include, but is not limited to an activity of heparin binding, heparin neutralization, inhibition of endothelial cell proliferation or inhibition of angiogenesis (e.g., inhibition of *in vivo* neovascularization such as that associated with metastatic tumors and chronic inflammatory disease states). Also included in this definition of "biological activity of BPI" is an activity of LPS binding, LPS neutralization, or 15 antimicrobial activity. Also expressly included in this definition of the "biological activity of BPI" is a biological activity, for example antimicrobial activity, that is qualitatively different than the activity of BPI or the corresponding peptide encompassing the entire corresponding domain of BPI. For example, such qualitative differences include differences in the spectrum of bacteria or other microorganisms 20 against which the peptide is effective, relative to the amino acid sequence of the corresponding functional domain of BPI. This definition thus encompasses antimicrobial activities, such as antibacterial activity (e.g., against gram-negative bacteria, gram-positive bacteria, mycobacteria and chlamydia) and antifungal activity (e.g., against species of *Candida*, *Aspergillus*, *Cryptococcus*, *Histoplasma*, 25 *Coccidioides*, *Blastomyces*, *Basidiobolus*, *Conidiobolus*, *Rhizopus*, *Rhizomucor*, *Mucor*, *Absidia*, *Mortierella*, *Cunninghamella*, *Saksenaea*, *Fusarium*, *Trichophyton*, *Trichosporon*, *Microsporum*, *Epidermophyton*, *Scytalidium*, *Malassezia*, *Actinomyceies*, *Sporothrix* and *Penicillium*), as well as anti-protozoal activity.

For the purposes of this invention, the term "derivatized" in the context of a 30 "derivatized construct" or "derivatized composition" refers to a peptide-based construct or composition comprising sequences covalently linked to a hydrophobic moiety. Preferably, the hydrophobic moiety is covalently linked to the N-terminus of the sequence. Preferably, the hydrophobic moiety is R<sub>2</sub> as defined herein.

Peptide-based constructs, including those suitable for derivatization, include sequences derived from or based on reverse substituted subsequences from functional domain II of human BPI (e.g., amino acids 99-92, 99-91, 99-90, 99-89, 99-88, 99-87, 99-86, or 99-85 wherein the substitutions are at 75 and 91)), preferably D-amino acid 5 moiety sequences. Embodiments of such constructs according to the invention include the following exemplary constructs [single-letter abbreviations for amino acids can be found in G. Zubay, *Biochemistry* (2d. ed.), 1988 (MacMillen Publishing: N.Y.), p.33]:

	XMP.394 (1)	k-l-f-r-(naph-a)-q-a-k-(naph-a)-k-g-s-i-k-i	(SEQ ID NO: 1)
10	XMP.624 (2)	k-l-f-r-(naph-a)-q-a-k-(naph-a)-k-g-s-i-k	(SEQ ID NO: 2)
	XMP.625 (3)	k-l-f-r-(naph-a)-q-a-k-(naph-a)-k-g-s-i	(SEQ ID NO: 3)
	XMP.626 (4)	k-l-f-r-(naph-a)-q-a-k-(naph-a)-k-g-s	(SEQ ID NO: 4)
	XMP.627 (5)	k-l-f-r-(naph-a)-q-a-k-(naph-a)-k-g	(SEQ ID NO: 5)
	XMP.628 (6)	k-l-f-r-(naph-a)-q-a-k-(naph-a)-k	(SEQ ID NO: 6)
15	XMP.629 (7)	k-l-f-r-(naph-a)-q-a-k-(naph-a)	(SEQ ID NO: 7)
	XMP.630 (8)	k-l-f-r-(naph-a)-q-a-k	(SEQ ID NO: 8)
	XMP.656 (9)	k-l-f-r-(naph-a)-q-a-k-(naph-a)-k-g-i-k-i	(SEQ ID NO: 9)
	XMP.679 (10)	k-l-f-k-(naph-a)-q-a-k-(naph-a)-k-g	(SEQ ID NO: 10)
	XMP.684 (11)	(biphenyl-A)-k-l-f-r-(naph-a)-q-a-k	(SEQ ID NO: 11)
20	XMP.685 (12)	k-l-f-r-(biphenyl-A)-q-a-k	(SEQ ID NO: 12)
	XMP.725 (13)	k-l-f-r-(biphenyl-a)-q-a-k	(SEQ ID NO: 13)
	XMP.728 (14)	k-l-f-k-(biphenyl-a)-q-a-k-(biphenyl-a)-k-G	(SEQ ID NO: 14)
	XMP.760 (15)	k-a-f-r-(naph-a)-q-a-k-(naph-a)	(SEQ ID NO: 15)
	XMP.764 (16)	k-a-f-k-(naph-a)-q-a-k-(naph-a)-k-G	(SEQ ID NO: 16)
25	XMP.776 (17)	k-l-f-k-(naph-a)-q-a-k-(naph-a)	(SEQ ID NO: 17)
	XMP.778 (18)	k-(aminoisobutyric acid)-f-r-(naph-a) -q-a-k-(naph-a)	(SEQ ID NO: 18)

Exemplary derivatized peptide-based constructs include:

30	XMP.661 (19)	2-biphenylcarbonyl-k-l-f-r-(naph-a)-q-a-k	(SEQ ID NO: 19)
	XMP.664 (20)	4-biphenylcarbonyl-k-l-f-r-(naph-a)-q-a-k	(SEQ ID NO: 20)
	XMP.666 (21)	2-naphthylacetyl-k-l-f-r-(naph-a)-q-a-k	(SEQ ID NO: 21)
	XMP.671 (22)	1-naphthylacetyl-k-l-f-r-(naph-a)-q-a-k	(SEQ ID NO: 22)

XMP.699 (23)	2-biphenylenecarbonyl-k-l-f-r-(naph-a)-q-a-k	(SEQ ID NO: 23)
XMP.767 (24)	4-biphenylcarbonyl-k-l-f-k-(naph-a)-q-a-k	(SEQ ID NO: 24)
XMP.768 (25)	4-biphenylcarbonyl-k-l-f-r-(biphenyl-a)-q-a-k	(SEQ ID NO: 25)
XMP.769 (26)	4-biphenylcarbonyl-k-l-f-k-(biphenyl-a)-q-a-k	(SEQ ID NO: 26)

5

As used herein, "BPI protein product" includes naturally and recombinantly produced BPI protein; natural, synthetic, and recombinant biologically active polypeptide fragments of BPI protein; biologically active polypeptide variants of BPI protein or fragments thereof, including hybrid fusion proteins and dimers; 10 biologically active polypeptide analogs of BPI protein or fragments or variants thereof, including cysteine-substituted analogs; and BPI-derived peptides. BPI protein products may be generated and/or isolated by any means known in the art. U.S. Patent No. 5,198,541, discloses recombinant genes encoding, and methods for expression of, BPI proteins including recombinant BPI holoprotein, referred to as 15 rBPI and recombinant fragments of BPI. U.S. Patent No. 5,439,807 and corresponding International Publication No. WO 93/23540 (PCT/US93/04752), which are all incorporated herein by reference, disclose novel methods for the purification of recombinant BPI protein products expressed in and secreted from genetically transformed mammalian host cells in culture and discloses how one may 20 produce large quantities of recombinant BPI products suitable for incorporation into stable, homogeneous pharmaceutical preparations.

Biologically active fragments of BPI (BPI fragments) include biologically active molecules that have the same or similar amino acid sequence as a natural human BPI holoprotein, except that the fragment molecule lacks amino-terminal 25 amino acids, internal amino acids, and/or carboxy-terminal amino acids of the holoprotein without loss of one or more of the biological activities or immunological properties of BPI. Nonlimiting examples of such fragments include an N-terminal fragment of natural human BPI of approximately 25 kD, described in Ooi et al., 1991, *J. Exp. Med.*, 174:649, and the recombinant expression product of 30 DNA encoding N-terminal amino acids from 1 to about 193 to 199 of natural human BPI, described in Gazzano-Santoro et al., 1992, *Infect. Immun.* 60:4754-4761, and referred to as rBPI<sub>23</sub>. In that publication, an expression vector was used as a source of DNA encoding a recombinant expression product (rBPI<sub>23</sub>) having the

31-residue signal sequence and the first 199 amino acids of the N-terminus of the mature human BPI, as set out in Figure 1 of Gray et al., *supra*, except that valine at position 151 is specified by GTG rather than GTC and residue 185 is glutamic acid (specified by GAG) rather than lysine (specified by AAG). Recombinant 5 holoprotein (rBPI) has also been produced having the sequence (SEQ ID NOS: 27 and 28) set out in Figure 1 of Gray et al., *supra*, with the exceptions noted for rBPI<sub>23</sub> and with the exception that residue 417 is alanine (specified by GCT) rather than valine (specified by GTT). An analog of an N-terminal fragment consisting of residues 10-193 of BPI has been described in U.S. Patent No. 6,013,631 and 10 corresponding International Publication No. WO 99/66044 (PCT/US99/13860), which are all incorporated herein by reference. Other examples include dimeric forms of BPI fragments, as described in U.S. Patent No. 5,447,913 and corresponding International Publication No. WO 95/24209 (PCT/US95/03125), which are all incorporated herein by reference.

15 Biologically active variants of BPI (BPI variants) include but are not limited to recombinant hybrid fusion proteins, comprising BPI holoprotein or biologically active fragment thereof and at least a portion of at least one other polypeptide, and dimeric forms of BPI variants. Examples of such hybrid fusion proteins and dimeric forms are described in U.S. Patent No. 5,643,570 and corresponding 20 International Publication No. WO 93/23434 (PCT/US93/04754), which are all incorporated herein by reference, and include hybrid fusion proteins comprising, at the amino-terminal end, a BPI protein or a biologically active fragment thereof and, at the carboxy-terminal end, at least one constant domain of an immunoglobulin heavy chain or allelic variant thereof.

25 Biologically active analogs of BPI (BPI analogs) include but are not limited to BPI protein products wherein one or more amino acid residues have been replaced by a different amino acid without loss of one or more of the biological activities or immunological properties of BPI. For example, U.S. Patent No. 5,420,019 and corresponding International Publication No. WO 94/18323 30 (PCT/US94/01235), which are all incorporated herein by reference, discloses polypeptide analogs of BPI and BPI fragments wherein a cysteine residue is replaced by a different amino acid. A stable BPI protein product described by this application is the expression product of DNA encoding from amino acid 1 to

approximately 193 or 199 of the N-terminal amino acids of BPI holoprotein, but wherein the cysteine at residue number 132 is substituted with alanine and is designated rBPI<sub>21</sub>Δcys or rBPI<sub>21</sub>. Production of this N-terminal analog of BPI, rBPI<sub>21</sub>, has been described in Horwitz et al., 1996, *Protein Expression Purification*, 8:28-40. Similarly, a fragment consisting of residues 10-193 of BPI in which the cysteine at position 132 is replaced with an alanine (designated "rBPI(10-193)C132A" or "rBPI(10-193)ala<sup>132</sup>") has been described in U.S. Patent No. 6,013,631 and corresponding International Publication No. WO 99/66044 (PCT/US99/13860, which are all incorporated herein by reference. Other examples include dimeric forms of BPI analogs; e.g. U.S. Patent No. 5,447,913 and corresponding International Publication No. WO 95/24209 (PCT/US95/03125) which are all incorporated herein by reference.

Other BPI protein products are peptides derived from or based on BPI produced by synthetic or recombinant means (BPI-derived peptides), such as those described in International Publication No. WO 97/04008 (PCT/US96/03845), which corresponds to U.S. Patent No. 5,858,974 and International Publication No. WO 96/08509 (PCT/US95/09262), which corresponds to U.S. Patent Application No. 09/365,539, and International Publication No. WO 95/19372 (PCT/US94/10427), which corresponds to U.S. Patent Nos. 5,652,332 and 5,856,438, and International Publication No. WO94/20532 (PCT/US94/02465), which corresponds to U.S. Patent No. 5,763,567 which is a continuation of U.S. Patent No. 5,733,872, which is a continuation-in-part of U.S. Application No. 08/183,222, which is a continuation-in-part of U.S. Application No. 08/093,202 (corresponding to International Publication No. WO 94/20128 (PCT/US94/02401)), which is a continuation-in-part of U.S. Patent No. 5,348,942, as well as International Publication No. WO 97/35009 (PCT/US97/05287), which corresponds to U.S. Patent No. 5,851,802, which are all incorporated herein by reference.

The present invention defines novel peptide-based constructs, including derivative constructs, that may be encompassed in the definition of BPI protein products.

The administration of BPI protein products is preferably accomplished with a pharmaceutical composition comprising a BPI protein product and a pharmaceutically acceptable diluent, adjuvant, or carrier. The BPI protein product

may be administered without or in conjunction with known surfactants or other therapeutic agents. A stable pharmaceutical composition containing BPI protein products (e.g., rBPI<sub>23</sub>) comprises the BPI protein product at a concentration of 1 mg/ml in citrate buffered saline (5 or 20 mM citrate, 150 mM NaCl, pH 5.0) 5 comprising 0.1% by weight of poloxamer 188 (PLURONIC® F-68, BASF Wyandotte, Parsippany, NJ) and 0.002% by weight of polysorbate 80 (TWEEN® 80, ICI Americas Inc., Wilmington, DE). Another stable pharmaceutical composition containing BPI protein products (e.g., rBPI<sub>21</sub>) comprises the BPI protein product at a concentration of 2 mg/ml in 5 mM citrate, 150 mM NaCl, 0.2% 10 poloxamer 188 and 0.002% polysorbate 80. Such preferred combinations are described in U.S. Patent Nos. 5,488,034; 5,696,090; 5,932,544; 5,955,427; 6,066,620; and 6,057,293 and corresponding International Publication No. WO 94/17819 (PCT/US94/01239), which are all incorporated herein by reference. As described in U.S. Patent No. 5,912,228, which is in turn a continuation-in-part of 15 U.S. Application No. 08/530,599, which is in turn a continuation-in-part of U.S. Application No. 08/372,104, and corresponding International Publication No. WO 96/21436 (PCT/US96/01095), which are all incorporated herein by reference, other poloxamer formulations of BPI protein products with enhanced activity may be utilized. Peptide-based constructs may be formulated like other BPI protein 20 products or may be formulated in saline or a physiological buffer.

Therapeutic compositions comprising BPI protein product (including the peptide-based constructs, including derivatized constructs, or compositions comprising such constructs of the invention) may be administered systemically or topically. Systemic routes of administration include oral, intravenous, 25 intramuscular or subcutaneous injection (including into a depot for long-term release), intraocular and retrobulbar, intrathecal, intraperitoneal (e.g. by intraperitoneal lavage), intrapulmonary (using powdered drug, or an aerosolized or nebulized drug solution), or transdermal. Topical routes include administration in the form of salves, ophthalmic drops, ear drops, or irrigation fluids (for, e.g., 30 irrigation of wounds).

When given parenterally, BPI protein product compositions are generally injected in doses ranging from 1 µg/kg to 100 mg/kg per day, preferably at doses ranging from 0.1 mg/kg to 20 mg/kg per day. The treatment may continue by

continuous infusion or intermittent injection or infusion, at the same, reduced or increased dose per day for, e.g., 1 to 3 days, and additionally as determined by the treating physician.

Those skilled in the art can readily optimize effective dosages and 5 administration regimens for therapeutic compositions comprising BPI protein product (including the constructs or compositions of the present invention), as determined by good medical practice and the clinical condition of the individual subject.

The constructs, including derivatized constructs, or compositions 10 comprising such constructs of the invention may be used in any of the therapeutic uses for which BPI products are known to be effective, including those described above and are expected to have epithelial cell absorption of at least about 0.001%, or more preferably at least about 0.01%, 0.1%, 1%, 10% or 20% or more. Constructs and compositions of the invention, particularly those that are 15 derivatized, can optionally be tested for their epithelial absorption properties by any assay known in the art, including the oral absorption or transport screening assays described in Examples 6, 7 or 8. The constructs are particularly useful in methods for binding and neutralizing exogenous heparin, methods for inhibiting endothelial cell proliferation, treating disorders associated with endothelial cell proliferation, 20 methods for inhibiting angiogenesis, and treating disorders associated with or involving angiogenesis, but may also be useful for other diseases or conditions treatable due to other biological activities of BPI, including infections or disorders associated with endotoxin and specifically including any of the diseases or 25 conditions described herein or known in the art with reference to BPI protein products.

Exogenous heparin compounds are commonly administered during surgical procedures requiring anticoagulation, such as cardiopulmonary bypass, cardiac catheterization or angioplasty, and hemodialysis. Exogenous heparin compounds are also administered to patients at risk of or suffering from thrombosis, e.g. 30 patients suffering from deep venous thrombosis, acute myocardial infarction, stroke, or pulmonary embolism.

Angiogenesis-associated disorders are disorders in which angiogenesis plays a role in the initiation or progression of disease. Angiogenesis is involved in a

number of conditions, illustrated below, and inhibition of angiogenesis is expected to be effective for treating any of these conditions (including inhibiting progression of the disease and ameliorating signs and symptoms of the disease).

Use of the constructs or compositions of the invention, including those derivatized according to the invention, in preparation of a medicament for any of these therapeutic uses is also contemplated.

Angiogenesis is of considerable importance in cancer conditions because new vessel production is required to support the rapid growth of cancer cells. Inhibition of angiogenesis thus may promote tumor regression in adult and pediatric oncology, including reducing growth of solid tumors/malignancies, locally advanced tumors, metastatic cancer, human soft tissue sarcomas, cancer metastases, including lymphatic metastases, blood cell malignancies, effusion lymphomas (body cavity based lymphomas), lung cancer, including small cell carcinoma, non-small cell cancers, breast cancer, including small cell carcinoma and ductal carcinoma, gastrointestinal cancers, including stomach cancer, colon cancer, colorectal cancer, polyps associated with colorectal neoplasia, pancreatic cancer, liver cancer, urological cancers, including bladder cancer, prostate cancer, malignancies of the female genital tract, including ovarian carcinoma, uterine endometrial cancers, and solid tumors in the ovarian follicle, kidney cancer, including renal cell carcinoma, brain cancer, including intrinsic brain tumors, neuroblastoma, astrocytic brain tumors, gliomas, metastatic tumor cell invasion-in the central nervous system, bone cancers, including osteomas, skin cancers, including malignant melanoma, tumor progression of human skin keratinocytes, and squamous cell cancer, hemangiopericytoma, and Kaposi's sarcoma.

Angiogenesis also plays a role in chronic inflammation, including chronic pancreatitis, dermatosis associated with chronic inflammation, including psoriasis, cirrhosis, asthma, multiple sclerosis, arthritis, including rheumatoid arthritis, reactive arthritis and chronic inflammatory arthritis, autoimmune disorders, including vasculitis, glomerulonephritis, experimental allergic encephalomyelitis (EAE), lupus, myasthenia gravis, ulcerative colitis, Crohn's disease, inflammatory bowel disease, chronic inflammation associated with hemodialysis, granulocyte transfusion associated syndrome; rejection reactions after allograft and xenograft

transplantation, including graft versus host disease; and other chronic inflammatory disorders.

Angiogenesis in the eye is involved in ocular neovascularization, proliferative retinopathy, retrobulbar fibroplasia, macular degeneration, neovascular 5 glaucoma and diabetic ocular disease, in particular, diabetic iris neovascularization and retinopathy.

Coronary atheroma are highly vascularized by a fragile capillary network, and rupture of these newly formed capillaries when they are exposed to high intravascular pressures may lead to hemorrhage into atherosclerotic plaques and 10 coronary occlusion. Inhibition of angiogenesis thus may reduce the growth of atherosclerotic plaques and may be useful in the treatment of atherosclerosis, ischemic heart disease, myocardial infarction, coronary heart disease, restenosis, particularly following balloon angiography, neointimal hyperplasia, disruption of intercellular junctions in vascular endothelium, hypertension, vessel injury, arterial 15 ischemia, arterial stenosis, peripheral vascular disease, stroke

Angiogenesis also occurs during the female reproductive cycle and is involved in endometriosis, uterine fibroids, other conditions associated with dysfunctional vascular proliferation (including endometrial microvascular growth) during the female reproductive cycle.

20 Angiogenesis is also involved in abnormal vascular growth, including cerebral arteriovenous malformations (AVMs), angiofibromas, and hemangiomas.

Concurrent administration of other therapeutic agents appropriate for the condition being treated (e.g., other agents that inhibit angiogenesis or cancer therapeutic agents if indicated) is also contemplated.

25 "Concurrent administration," or "co-administration," as used herein includes administration of the agents, in conjunction or combination, together, or before or after each other. The BPI protein product and second agent(s) may be administered by different routes. For example, the BPI protein product may be administered intravenously while the second agent(s) is(are) administered intravenously, 30 intramuscularly, subcutaneously, orally or intraperitoneally. The BPI protein product and second agent(s) may be given sequentially in the same intravenous line or may be given in different intravenous lines. Alternatively, the BPI protein product may be administered in a special form for gastric delivery, while the second

agent(s) is(are) administered, e.g., orally. The formulated BPI protein product and second agent(s) may be administered simultaneously or sequentially, as long as they are given in a manner sufficient to allow all agents to achieve effective concentrations at the site of action.

5 Other aspects and advantages of the present invention will be understood upon consideration of the following illustrative examples wherein: Example 1 addresses preparation and purification of peptide-based constructs, including derivatized constructs; Example 2 addresses *in vitro* activity of peptide-based constructs, including derivatized constructs, in an endothelial cell proliferation assay; Example 3  
10 addresses *in vivo* testing of the anti-angiogenic activities of peptide-based constructs, including derivatized constructs; Example 4 addresses the *in vivo* testing of peptide-based constructs, including derivatized constructs, in models of chronic inflammatory disease states; Example 5 addresses testing of peptide-based constructs, including derivatized constructs, in a malignant melanoma metastasis model; Example 6  
15 addresses the *in vitro* testing of peptide-based constructs, including derivatized constructs, in oral absorption screening assays; Example 7 addresses the *in vivo* testing of peptide-based constructs, including derivatized constructs, for oral absorption; Example 8 addresses *in vivo* testing of peptide-based constructs, including derivatized constructs, for oral activity; Example 9 addresses the *in vitro* and *in vivo* testing of peptide-based constructs, including derivatized constructs, in retinal neovascularization models; Example 10 addresses the testing of peptide-based constructs, including derivatized constructs, for heparin neutralization; and Example 11 addresses the testing of peptide-based constructs, including derivatized constructs, in additional activity assays for BPI protein products.

25

#### EXAMPLE 1

##### PREPARATION AND PURIFICATION OF PEPTIDE-BASED CONSTRUCTS

30 This example addresses the preparation and purification of peptide-based constructs, including derivatized constructs, according to the invention.

Peptide-based constructs may be prepared according to a variety of synthetic procedures. For example, BPI-derived peptides have been prepared by solid phase

peptide synthesis as described in co-assigned U.S. Patent Application No. 08/183,222 and U.S. Patent No. 5,733,872, according to the methods of Merrifield, 1963, *J. Am Chem. Soc.* 85: 2149 and Merrifield *et al.*, 1966, *Anal. Chem.*, 38: 1905-1914 using an Applied Biosystems, Inc. Model 432 peptide synthesizer.

5 Alternatively, BPI-derived peptides have been synthesized on a larger scale using solid phase peptide synthesis on an Advanced Chemtech (ACT-Model 357 MPS) synthesizer utilizing a 1-Fluorenylmethyl-oxy carbonyl (Fmoc) protection strategy with a double coupling procedure employing N,N-diisopropylcarbodiimide (DIC or DIPCDI)/1-hydroxybenzotriazole (HOBr) and 2-(1-H-benzotriazol-1-yl)-1,1,3,3,-  
10 tetramethyluronium hexa-fluorophosphate (HBTU)/HOBr/ diisopropylethylamine (DIEA) as described in U.S. Patent No. 5,858,974.

The solid support used in the synthesis of peptide-based constructs of the present invention was a polystyrene resin with 1% divinylbenzene (DVB) cross-linking and an 4-(2',4'-dimethoxyphenyl-Fmoc-aminomethyl)-phenoxy (Fmoc-Rink  
15 amide) linker with a substitution rate of 0.56 mmoles/gram. A scale between 0.1 grams and 5 grams of starting resin may be used, and was generally 0.25 grams for the synthetic peptide-based constructs described herein.

For such syntheses, dimethylformamide (DMF) was the primary solvent with a 50/50 solution of piperidine/DMF used for Fmoc deprotection in three consecutive  
20 treatments of 1, 5, and 10 minutes, respectively. A double coupling procedure was used in each cycle with a 4:1 amino acid to peptide ratio used in each coupling. The amino acids were dissolved in a 0.5M HOBr solution in N-methylpyrrolidinone (NMP) at a concentration also of 0.5M. For the first coupling, an equimolar (to amino acid) amount of a 0.5M solution of diisopropylcarbodiimide (DIPCDI) in NMP was  
25 used and allowed to react for 45 minutes. The second coupling utilized an equimolar (to amino acid) volume of a 0.5M HBTU solution in DMF with an equal volume of a 1M DIEA solution in NMP (2:1, DIEA:amino acid) for a period of 30 minutes.

Upon completion of the synthesis, the resin was treated with MeOH, dried under reduced pressure, and then cleaved using a cocktail composed of trifluoroacetic acid (TFA) : thioanisole : ethanedithiol (EDT) : water, at a ratio of 36:2:1:1 (with the volume dependent on the amount of resin) for 2 hours (a minimum of 2 hours was used with an additional 30 minutes added for each arginine, but not exceeding 3 hours) with the first 15 minutes occurring in a wet ice bath. The solutions were then

dissolved in a 10% TFA in water solution, washed 3 times with methyl t-butyl ether (MTBE) and lyophilized.

The amino termini of selected peptide-based constructs may be derivatized with acetic anhydride or other organic carboxylic acid after synthesis on solid phase  
5 using an N-terminal Fmoc protection strategy as described above. Subsequent to Fmoc removal with piperidine and prior to peptide cleavage with TFA, peptide on the resin could be derivatized with a 10-fold molar excess of acetic anhydride or 4-fold molar excess of other organic carboxylic acid with a 2-fold molar excess of diisopropylethylamine in dimethylformamide for one hour or a double coupling  
10 procedure employing N, N-diisopropylcarbodiimide (DIC) or CIPCdi/1-hydroxybenzotriazole (HOBt) and 2-(1-H-benzotriazol-1-yl)-1.1.3.3.-tetramethyluronium hexa-fluorophosphate (HBTU)/ HOBt/diisopropylethylamine (DIEA) and one of a variety of building blocks could be used for derivatization. The peptide was then cleaved from the resin with the TFA cleavage cocktail as described  
15 above and purified as described below. Derivatization, including N-terminal acetylation, of the purified peptide was verified by mass spectrometry.

Yields of the peptide-based constructs described in Table I ranged from 4.8 to 57.8%. All HPLC purities were generally greater than 90% and mass was construed by mass spectrometry.

20 For purity analysis of each newly synthesized peptide-based construct, dilute solutions of lyophilized peptide-based constructs were prepared and analyzed on a Michrom Ultrafast Microprotein Analyzer equipped with a 150 mm X 1 mm, 5 $\mu$  particle, 300 Å pore C-8 Zorbax column. The column oven was set to 40° C, the flow rate was 100  $\mu$ L/minute, and injection volumes were typically 5-10  $\mu$ L. HPLC was  
25 performed using 5% acetonitrile/0.1% TFA in water as mobile phase A, and 80% acetonitrile/0.065% TFA as mobile phase B. The eluate was monitored spectrophotometrically at 214 nm. Percent purity was calculated from the peak area of the individual peptide constructs.

30 Selected constructs were purified by high performance liquid chromatography (HPLC), using a Waters Prep LC 2000 Preparative Chromatography System (Waters Corp., Milford, MA) equipped with a Delta Pak C-18, 15  $\mu$ m, 300 Å cartridge column consisting of a 40 X 10 mm guard cartridge and a 40 X 100 mm Prep Pak cartridge.

The column was equilibrated in 25% buffer B, where A=5% acetonitrile/0.1% trifluoroacetic acid and B=80% acetonitrile/0.065% trifluoroacetic acid. Such peptide-based constructs were dissolved to ~ 20 mg/mL in buffer A and 200-800 mg were applied to the column through the LC pump operating at a flow rate of 8-17 mL/min.

5 Bound material was eluted with an empirically determined gradient of buffer B, for example, a gradient of 25-35% buffer B, per 30 min applied at 8-17 mL/min. (Some constructs were purified with a gradient of 23-43% buffer B/30 min; other constructs were purified with a variety of gradients such as 25-45%, 0-60%, 30-70%, 25-75%, 30-60% or 35-75% buffer B/30 min.) The eluate was monitored at 220 and/or 280

10 and 300 nm with a Waters 490E Programmable Multiwavelength Detector. Fractions were collected and assayed for the construct of interest on an Ultrafast Micoprotein Analyzer (Michrom BioResources, Inc., Pleasanton, CA) equipped with a Zorbax C-8, 150 X 1 mm, 5  $\mu$ m, 300  $\text{\AA}$  maintained at 40°C. Fractions containing the construct of interest at  $\geq$ 90% purity were pooled and lyophilized to dryness. The purity of the

15 recovered material was determined with analytical reverse-phase HPLC.

<sup>(a)</sup> by convention amino acid moieties written in lower case (e.g., lys) represent D-amino acid moieties and in upper case (e.g., LYS) represent L-amino acid moieties; there is only one form of glycine (no D,L) and can be represented as GLY or G or as gly or g.

**EXAMPLE 2**  
***IN VITRO HUVEC ASSAY***

5 This example addresses the activity of peptide-based constructs, including derivatized constructs, in an *in vitro* assay of endothelial cell proliferation.

Briefly, human umbilical vein endothelial cells (HUVEC) were cultured in EGM-2 medium (Clonetics Corp., San Diego, CA), harvested and plated onto a 96-well culture plate. After 24 hours of quiescence, the cells were co-cultured with  
10 various peptide-based constructs in the presence of growth factors for 72 hours to test their activity. Cell proliferation was quantitated by tritiated thymidine incorporation into DNA and was expressed in counts per minute (cpm).

Details of the experimental procedures were as follows: HUVEC cells were cultured in EGM-2 media from Clonetics Corp., a subsidiary of BioWhittaker, Inc.,  
15 San Diego, CA [EGM-2 is Endothelial Cell Basal Medium-2 (EMB-2) supplemented with growth factors (hFGF-B, VEGF, IGF-1, hEGF) ascorbic acid, heparin, GA-1000 and 2% FBS), in T75 flasks until confluent (~ 4-7 days). Cells were harvested by trypsinizing the cells using 0.025% trypsin/EDTA for 5 minutes. To stop the reaction, 2-5% FBS was added. The cells were centrifuged and washed 3 times using  
20 Hank's Balanced Salt Solution (HBSS) or Dulbecco's Phosphate Buffered Saline D-PBS. The pellet was then resuspended in EBM-2 supplemented with 0.1% FBS and GA-1000 was used. The cells were counted and a cell suspension was prepared at  $2 \times 10^5$ /mL in EBM-2 with 0.1% FBS; cells were dispensed into a 96-well flat bottomed culture plate at 0.1 mL/well (total: ~ 20,000 cells/well in 0.1% FBS-EBM-2).  
25 Incubation continued at 37° C in 5% CO<sub>2</sub> for 20-24 hours. The next day peptide-based constructs were prepared for testing in a 96 well plate. The supernatant was aspirated from the cell-well, replaced with EBM-2 or the testing reagent at 20 μL/well. Then,  
180 μL/well of 1.12% FBS-GFS were added to make a final concentration of 1% FBS-GFS in EBM-2. This aspiration and addition was done well-by-well. <sup>3</sup>H-thymidine (100 μCi/mL) was added at 10 μL/well (1μCi/well, final). Incubation continued at 37° C, 5% CO<sub>2</sub> for 72 hours. To harvest the plate, the supernatant was aspirated off from the cell-well and then 75 μL-100 μL/well of 0.025% trypsin-EDTA  
30

was added. After incubation for 8-10 minutes at room temperature in the hood, the cells were checked and 100 µL/well of 2-5% FBS-PBS was added to stop the reaction. The plate was then harvested, dried and counted using an Inotech cell harvester (Inotech Biosystems, INB-384, Sample Processing and Filter Counting System, 5 Lansing, MI).

Results of such HUVEC proliferation assays are shown in Table II. Tested in crude form (purity >73%) or purified, peptide-based constructs according to the invention inhibited HUVEC proliferation.

Inhibitory activity with a 9-amino acid construct (XMP.629) was similar to that of the 15-amino acid parent construct (XMP.394). In repeated experiments (8 total), XMP.679 exhibited IC<sub>50</sub> values consistently in the range between 3 and 10 (3< x <10).

- 5 In additional assays using purified XMP.624, XMP.625, XMP.626, XMP.627, XMP.629 and XMP.630, IC<sub>50</sub> values were comparable to those shown in Table II (4.9 ± 0.5, 1< x <3 (7 experiments), 3< x <10 (2 experiments), 3< x <10 (3 experiments), 3< x <10 and >50, respectively).

10

### EXAMPLE 3

#### *IN VIVO MATRIGEL® ANGIOGENESIS ASSAYS*

This example addresses the activity of peptide-based constructs, including derivatized constructs, in *in vivo* assays of angiogenesis using Matrigel®.

- 15 For these experiments, peptide-based constructs according to the invention were assayed for their ability to inhibit heparin-induced angiogenesis *in vivo* in mice. Basement membrane matrix (Matrigel®, Becton Dickinson Labware, Mountain View, CA) was thawed and maintained at 4° C and angiogenic factors were added to the gel in the liquid state generally as described in Passaniti *et al.*, 1992, *Lab. Invest.* 67: 519-528. Heparin sodium (Sigma, St. Louis, MO) was dissolved in sterile PBS to various concentrations ranging from 1,250 - 10,000 U/mL, and used in these experiments at 8,000 U/mL. Human recombinant basic fibroblast growth factor (bFGF; Sigma) was reconstituted into 1% BSA in PBS to 25 µg/mL. A volume of 2.5 µL dissolved heparin solution and 4.0 µL recombinant bFGF were added to 0.5 mL Matrigel® mixture per mouse injection. Peptide-based constructs were added to this Matrigel® mixture at varying concentrations ranging from 0.5 to 50 µg/mL (final concentration) in 10 µL/0.5 mL Matrigel® aliquot per experimental animal. Ten µL sterile PBS was
- 20
- 25

substituted for peptide-based constructs in Matrigel® aliquots injected into control animals.

Female C57BL/6J mice (Jackson Laboratory, Bar Harbor, ME) at 6-8 weeks of age (maintained under NIH guidelines) were injected subcutaneously down the dorsal midline with 0.5 mL aliquots of Matrigel® prepared as described above. Ten days after injection, the Matrigel® gels were excised and placed in Drabkin's reagent (Sigma). Total protein and hemoglobin content can be determined for the gels stored in Drabkin's reagent after mechanical homogenization of the gels. Hemoglobin concentration was measured using Sigma Procedure #525 and reagents supplied by Sigma (St. Louis, MO) to be used with this procedure. If desired, total protein levels are determined using a microplate assay that is commercially embodied in a kit (*DC Protein Assay*, Bio-Rad, Richmond, CA).

Gels to be used for histological staining are formalin-fixed immediately after excision from the animals rather than being placed in Drabkin's reagent. Formalin-fixed gels are embedded in Tissue-Tek O.C.T. compound (Miles, Inc., Elkhart, IN) for frozen sectioning. Slides of frozen sections are stained with hematoxylin and eosin (as described by Humason, 1979, *Animal Tissue Techniques*, 4<sup>th</sup> Ed. W.H. Freeman & Co., San Francisco, CA, Ch. 9, pp. 111-131). The effect of peptides are detected by microscopic examination of frozen stained sections for inhibition of angiogenesis relative to Matrigel® gel slices prepared without added peptides. The extent of angiogenesis inhibition is quantitated using the normalized amounts of hemoglobin found in BPI peptide-containing gel slices.

Results of Matrigel® assays with 10 µg peptide construct per gel are shown in Table III. Data are presented as the means of triplicate determinations of hemoglobin concentrations from the excised gel (ISEM) with ten mice per group.

TABLE III

Peptide Construct (SEQ ID NO:)	% Inhibition	p-value
XMP.394 (1)	54.6	0.03
XMP.624 (2)	ND	ND
XMP.624 (3)	51.9	0.04
XMP.626 (4)	ND	ND
XMP.627 (5)	77.6	0.003
XMP.628 (6)	ND	ND
XMP.629 (7)	30.8	0.22
XMP.630 (8)	49.6	0.05

ND - Not Determined

Peptide-based constructs inhibited bFGF-induced angiogenesis. Matrigel® assay results corroborated HUVEC assay results described in Example 2.

In additional experiments, an *in vivo* angiogenesis assay was developed using 5 Matrigel® and melanoma cells ("mel-gel" assay). Female C57B1/6J mice, as described above, were used at 6-8 weeks of age and maintained under NIH guidelines. Basement membrane matrix (Matrigel®), as described above, was thawed at 4°C prior to the addition of B16.F10 malignant melanoma cells at 50 µL per 0.5 mL of Matrigel®. Final concentration of B16.F10 melanoma cells was varied from 10,000 to 10 100,000 cells/0.5 mL of Matrigel®. For this assay, peptide-based constructs at 50 µL (final concentration varies from 1.0 to 50.0 µg/0.5 mL of Matrigel®) are premixed with B16.F10 melanoma cells and added directly to Matrigel® prior to the subcutaneous injection near the abdominal midline. Fifty (50) µL sterile PBS is substituted for the constructs in Matrigel® aliquots injected into control animals. Ten 15 days after the injections, gels are excised and placed in Drabkin's reagent (Sigma), as described above. Total hemoglobin content is determined for the gels stored in Drabkin's reagent after mechanical homogenization of the gels, as described above. Hemoglobin concentration is measured, as described above, using Sigma procedure #525 and reagents supplied by Sigma (St. Louis, MO) to be used in this procedure. 20 Data from mel-gel assays are presented as the mean of triplicate determinations of hemoglobin concentrations from the excised gel (ISEM) with ten mice per group.

**EXAMPLE 4****CHRONIC INFLAMMATORY DISEASE STATE MODELS:  
COLLAGEN-INDUCED ARTHRITIS OR REACTIVE ARTHRITIS**

5

This example addresses the *in vivo* activity of peptide-based constructs, including derivatized constructs, when they are administered for their effects in chronic inflammatory disease states such as arthritis.

For the collagen-induced arthritis model, arthritis is induced in mice by 10 intradermal immunization of bovine Type II collagen at the base of the tail according to the method of Stuart *et al.*, 1982, *J. Clin. Invest.* 69: 673-683. Generally, mice begin to develop arthritic symptoms at day 21 after collagen immunization. The 15 arthritic scores of the treated mice are then evaluated in a blinded fashion over a period of 120 days for mice treated on each of days 21-25 with injection intravenously via the tail vein of peptide-based constructs prepared in accordance with Example 1, or of buffer as a control.

Specifically, bovine Type II collagen (Southern Biotechnology Associates, Inc., Birmingham AL) is administered *via* intradermal injection (0.1 mg/mouse) at 20 the base of the tail on day 0 to groups of male mice (Mouse/DBA/1J), each weighing approximately 20-25 g. Peptide-based constructs are dissolved in a buffer comprised of 0.5M NaCl, 20mM sodium acetate (pH 6.0) and diluted with PBS buffer for administration at various concentrations. PBS buffer alone (0.1 mL) is administered as a control.

The collagen-induced arthritis model is also used to evaluate the performance 25 of peptides in comparison with protamine sulfate. Specifically, peptide-based constructs are dissolved in PBS as described above and administered at various concentrations. The other test materials are administered at the following dosages: protamine sulfate (Sigma Chemical Co., St. Louis, MO) (0.13 mg/mouse), thaumatin control protein (0.12 mg/mouse), and PBS buffer (0.1 mL). Groups of mice receive 30 test or control materials through intravenous injection *via* the tail vein on each of days 28 through 32 post-injection with collagen.

For the reactive arthritis model, peptide-based constructs are administered to treat reactive arthritis in a *Yersinia enterocolitica* reactive arthritis model according to

the method of Yong *et al.*, 1988, *Microbial Pathogenesis* 4: 305-310. Specifically, peptide-based constructs are administered to DBA/2J mice which have previously been injected intravenously with *Yersinia enterocolitica* cWA 0:8 T2 (*i.e.*, lacking the virulence plasmid according to Yong *et al.*, *supra*) at a dosage of  $4 \times 10^8$  bacteria  
5 calculated to induce a non-septic arthritis in the mice. Groups of mice each receive test or control materials through intravenous injection via the tail vein.

10 *Borrelia burgdorferi* is the pathogen responsible for Lyme Disease and associated arthritis and it possesses an LPS-like complex on its cell walls which is different from but structurally related to that of *E. coli*. The effect of administration of the peptide-based constructs on inhibition of *B. burgdorferi* LPS in a *Limulus* Amoebocyte Lysate (LAL) inhibition assay is determined. Specifically, an LAL assay is conducted measuring the effect of peptide-based constructs on *B. burgdorferi* LPS administered, for example, at 2.5  $\mu\text{g/mL}$  and *E. coli* 0113 LPS administered, for example, at 2 ng/mL.  
15

#### EXAMPLE 5

##### MALIGNANT MELANOMA METASTASIS MODEL

This example addresses the activity of peptide-based constructs, including  
20 derivatized constructs in an *in vivo* malignant melanoma metastasis model.

For these experiments, peptide-based constructs, protamine, or buffer controls are administered to test their efficacy in a mouse malignant melanoma metastasis model. Specifically, groups of C57BL/6J mice are inoculated with  $10^5$  B16.F10 malignant melanoma cells *via* intravenous injection into the tail vein on day 0.  
25 Peptide-based constructs prepared in accordance with Example 1 in various concentrations are administered into the tail vein of test mice on days 1, 3, 6, 8, 10, 13, 15, 17, and 19. Protamine sulfate (0.13 mg/mouse) as a positive control, or PBS buffer (0.1 mL/mouse) as a negative control are similarly administered to additional groups of control mice. The animals are either sacrificed *via* cervical dislocation on  
30 day 20 for observation of lung tissues or observed for mortality until day 40. The lobes of each lung are perfused and inflated by injecting 3 mL water into the lung *via* the trachea. Superficial tumor nodules are then counted with the aid of a dissecting microscope and the number of tumors found per group analyzed for statistically

significant differences. Such analyses identify those constructs with efficacy that significantly reduce the number of tumors and significantly prolong survival.

## EXAMPLE 6

### 5 IN VITRO ORAL ABSORPTION SCREENING

This example addresses the activity of peptide-based constructs, including derivatized constructs, in *in vitro* transport screening assays.

For these experiments, peptide-based constructs are screened for potential oral absorption in *in vitro* screening assays using MDCK and/or CACO-2 cells. Briefly, cultured monolayers of Madin-Derby canine kidney epithelial (MDCK) cells (ATCC Accession No. CCL-34) and/or CACO-2 (Human colon carcinoma) cells (Audus, K.L., et al., 1990, *Phar. Res.*, 7:435-451) are grown upon collagen-coated, permeable-filter supports (Becton Dickinson, Mountain View, CA). The cells are grown to confluence and allowed to differentiate (e.g., about 3 days for MDCK cells or about 21 days for CACO-2 cells). The integrity of the monolayers is determined by measuring the transepithelial resistance. The cells are incubated with a peptide-based construct on the apical side for 2.5 hours in MDCK or CACO-2 screening. The transepithelial transport of the construct is measured by quantitative HPLC analysis of the incubation media on the basolateral side of the cells (forward transport). Radiolabelled mannitol and/or cortisone are used as positive controls. In addition, the efflux of the construct is measured by quantitative HPLC analysis of the incubation media on the apical side of the cells. This follows incubation of the cells with construct on the basolateral side for 2.5 hours.

25 Details of the experimental procedures were as follows: MDCK or CACO-2 cells are grown to ~ 90% confluence in T75 tissue culture flasks in cell growth media (for MDCK cells, Minimum Essential Medium (Eagle's) GIBCO (Grand Island, NY) #11095-080 or for CACO-2 cells, DMEM, GIBCO #11965-050, high glucose - 500 mL; FBS 10% (Hyclone) heat treated - 50 mL; L-Glutamine (200 mM) GIBCO 30 #25030-016 - 5 mL; for CACO-2 cells, Non-essential amino acids, GIBCO #11140-050 (200 mM, 100x) - 5.5 mL; and Penicillin/Streptomycin (100 µg/mL) GIBCO #15140-015 - 5mL, that has been filtered and stored at 4° C). The cells are trypsinized (~ 20 minutes for MDCK cells for passaging due to their tight adherence) and seeded

on 24.5 mm transwells (Transwell-COL, #3245, Corning CoStar Corp., Cambridge, MA) at a concentration of ~  $3 \times 10^6$  MDCK cells/well or ~  $3 \times 10^5$  CACO-2 cells/well. For the MDCK cells, media is changed one day post seeding and the MDCK cells are allowed to grow for an additional 2 days. For the CACO-2 cells, media is changed every 2 days post seeding and the CACO-2 cells are allowed to grow for a total of up to 21 days.

Following the days post seeding, the cells are ready for transport experiments. The cells are fed fresh media 2 hours before starting the transport experiment. The cells are then washed with transport media (TM: Hank's Balanced Salt Solution (HBSS) GIBCO #14025-027, with no phenol red; 10 mM HEPES (from 1 M HEPES) GIBCO #15630-015, pH balanced with NaOH to 7.4) and placed in new 6 well plates. Donor solutions of peptide-based constructs for assay are prepared in 1.5 mL TM at a concentration of ~ 100  $\mu$ g/mL. For forward transport studies, these 1.5 mL construct solutions are added to the apical chamber of the transwells. Approximately 2.6 mL of acceptor solution (TM only, no construct) is added to the basolateral chamber. For efflux studies, the donor solution with construct is added to the basolateral chamber and acceptor solution (TM only, no construct) is added to the apical chamber. Each construct is assayed at least in triplicate.

The transwells are returned to the 37° C tissue culture incubator for 2.5 hours. At the end of 2.5 hours the apical and basolateral solutions are separately freeze dried (lyophilized) in high vacuum in 15 mL conical tubes. The samples are then resuspended in 200  $\mu$ L HPLC buffer A (5% acetonitrile: 95% water: 0.1% tetrafluoroacetic acid (TFA)) and 50  $\mu$ L of the resuspended sample is used for HPLC analysis.

Apical control wells containing 1.5 mL TM with tritiated mannitol ( $^3$ H-mannitol, 1  $\mu$ Ci/mL; Dupont NEN Research Products, #NET-101, Boston, MA) are analyzed separately for counts per minute (cpm) of tritium to test the integrity of the MDCK cell monolayers.

Forward transport is calculated as the percentage of peptide-based construct in the basolateral chamber (determined by the area under the HPLC peak) to the initial concentration of the apical solution (initial donor concentration of ~ 100  $\mu$ g/mL). For efflux experiments, the reverse calculation is made (percentage of peptide-based

construct in the apical chamber to the initial construct concentration in the basolateral solution). Such intestinal absorption screening identifies constructs that are potential orally available compounds.

5

**EXAMPLE 7*****IN VIVO ORAL ABSORPTION SCREENING***

This example addresses the activity of peptide-based constructs, including derivatized constructs, for oral absorption in an *in vivo* screening assay in which 10 constructs are administered by oral gavage to mice.

Briefly, serum concentrations of the constructs are measured at various time intervals after administration by HPLC. For example, constructs may be administered to mice at various dosages (e.g., 10 mg/kg body weight or 20 mg/kg body weight) and serum peptide concentrations are measured at various time intervals (e.g., 1 hours, 4 15 hours, and/or 24 hours) after administration to the mice. HPLC analysis identifies constructs that are absorbed after oral administration. Such constructs showing increased oral availability may achieve therapeutically effective serum concentrations after oral administration.

20

**EXAMPLE 8****ORAL ACTIVITY**

This example addresses the activity of peptide-based constructs, including derivatized constructs, for activity upon oral administration (oral activity) in an *in vivo* animal model. 25

Animal models useful for testing oral activity include those described in Examples 4 and 5 above. Treatment is initiated by oral gavage (~ 400 µl) of either 0.5% dextrose, or the test peptide-based construct in 0.5% dextrose at various dosage levels (e.g., 10 mg/kg or 20 mg/kg according to the dosing regimen). Daily 30 monitoring for efficacy is performed. The animals treated with orally active peptide-based constructs show improvement compared with the dextrose-treated controls.

**EXAMPLE 9**  
**RETINAL NEOVASCULARIZATION MODEL**

5        This example addresses the *in vivo* activity of peptide-based constructs, including derivatized constructs, when they are administered for their effects in a retinal neovascularization model.

10      In these experiments, peptide-based constructs are tested for their activity on the action of VEGF, bFGF, IGF-1 and conditioned media (hypoxia and hyperglycemia) on the *in vitro* growth and migration of retinal pigmented epithelial cells (RPE), retinal microvessel pericytes, and retinal endothelial cells. Effects are evaluated on gene expression under hypoxic or hypoglycemic conditions. In additional experiments, the effects of such constructs are characterized *in vivo* on the neovascular responses to hyperoxia in the retina of the neonatal mouse.

15      For the *in vitro* culture experiments, retinal microvessel pericytes, retinal endothelial cells, and retinal pigmented epithelial cells (RPE) are cultured from bovine retina. Dose responses and time course for growth and migration as stimulated by VEGF, bFGF, and IGF-1 are performed. For example, retinal endothelial cell growth as stimulated by VEGF was inhibited with 5 µg/mL and 15 µg/mL XMP.679 as measured by DNA content (ng/cell well). The cell growth as measured by DNA content in the XMP.679-treated VEGF-stimulated cells was comparable with that of cells not stimulated by VEGF. In addition, conditioned media collected from cultured RPE, pericytes, and endothelial cells exposed to hypoxic or hyperglycemic conditions is collected in serum free media. When the dose responses of these growth factors and 20     conditioned media are determined, the effect of peptide-based constructs independently, and in combination with the growth factors described above, are tested in growth and migration assays.

25      For the *in vivo* experiments, studies are performed to evaluate the effect of peptide-based constructs on retinal neovascularization. Neonatal mice are exposed to 100% O<sub>2</sub> for an extended period of time and then removed. This increased oxygenation delays development of the retinal vasculature such that, when they are returned to room air, the retinas are severely hypoxic and release of many cytokines occur, including VEGF, bFGF, IGF-1, and others. Retinal neovascularization occurs

in 100% of animals. The severity of retinal neovascularization is quantitated by counting endothelial cell nuclei internal to the internal limiting membrane in retinal sections. VEGF and KDR expressions are evaluated by *in situ* hybridization, Northern and Western blot analysis. Tyrosine phosphorylation pattern of the whole retina is also evaluated by Western blot analysis. Peptide-based constructs are identified that inhibit or reduce retinal neovascularization.

## EXAMPLE 10

### HEPARIN BINDING AND NEUTRALIZATION

10

This example addresses heparin binding and heparin neutralizing activities of peptide-based constructs, including derivatized constructs.

A Chromostrate™ assay was used to determine the effect of peptide-based constructs, including derivatized constructs, and the effect protamine sulfate (as a positive control) on Factor Xa neutralization by ATIII/heparin complexes. The assay was conducted using a Chromostrate™ heparin anti-Factor Xa assay kit (Organon Teknika Corp., Durham, N.C.). Heparin concentration was varied so that a heparin standard curve was generated. The assay measured the potentiating effect of heparin on anti-Xa activity *in vitro*. Solution containing heparin is incubated in the presence of ATIII with an excess of Factor Xa, forming an ATIII-Heparin-Xa complex. The remaining Xa catalyzes the release of p-nitroaniline (pNA) from the chromogenic substrate. The release of p-nitroaniline is measured at 405 nm. The absorbance obtained is inversely proportional to the concentration of heparin in the sample.

Reagents for the assay are prepared as follows. Heparin, peptide-based constructs and protamine sulfate stocks are made in saline. Stock solutions are approximately 1mg/mL=1 $\mu$ g/ $\mu$ L. Factor Xa reagent and substrate reagent are reconstituted with 2.0 mL purified water. Antithrombin III (ATIII) reagent is reconstituted with 1.0 mL purified water. The assay is performed in 96 well microtiter plates. Assay components are added to the microtiter wells as follows: 12.5  $\mu$ L of heparin (from 0 to 10 U/mL), 25  $\mu$ L of construct or protamine sulfate, 12.5  $\mu$ L of ATIII (0.5 PEU/mL), 25  $\mu$ L of bovine Factor Xa (14 nKat/mL), 25  $\mu$ L substrate (3  $\mu$ moles/mL). The reaction is allowed to proceed for 20 minutes and then 25  $\mu$ L of

0.1M acetic acid is added. The color reaction is quantitated on a microplate reader at 405nm. Constructs that neutralize heparin show an increase in the absorbance at 405 nm. Protamine is used as a positive control and its activity is designated as 100%. The percent (%) heparin neutralization for each peptide construct is calculated relative 5 to the neutralization by protamine (100%), and shown in Table IV.

TABLE IV

Peptide Construct (SEQ ID NO:)	% Assay A <sup>a</sup>	% Assay B <sup>a</sup>

## EXAMPLE 11

### ADDITIONAL ACTIVITY ASSAYS

5 This example addresses the testing of peptide-based constructs, including derivatized constructs, for their activity, in a variety of assays known in the art for activities of BPI protein products.

Assays useful for testing a variety of biological activities of BPI protein products, including BPI-derived peptides, are described in co-owned U.S. Patent Nos. 10 5,733,872; 5,763,567; 5,652,332; and 5,856,438 and corresponding PCT Publication Nos. WO 94/20532 (PCT/US94/02465) and WO 95/19372 (PCT/US94/10427) and U.S. Patent No. 5,858,974 and corresponding PCT Publications Nos. WO 96/08509 (PCT/US95/09262) and WO 97/04008 (PCT/US96/03845), incorporated herein by reference. These activities include antimicrobial (including antibacterial and 15 antifungal), LPS binding, LPS neutralization and additional assays of heparin binding as well as heparin neutralization. When the peptide-based constructs, including the derivatized constructs, shown in Table I were tested in broth and/or radial diffusion assays (substantially in accordance with for example, Example 2 of U.S. Patent No. 5,858,974 except that for the broth assays with *Candida* cells were diluted to  $5 \times 10^3$  20 cells/mL instead of  $2 \times 10^6$  cells/mL in broth, and Examples 2 and 13 of U.S. Patent No. 5,652,332 except that for the broth assays with the bacteria tryptic soy broth was used instead of Mueller Hinton) for their antimicrobial effect on *E. coli* (J5 and 0111B4), *Staphylococcus aureus* and *Candida albicans*, each construct showed antimicrobial activity against one or more bacterial strains and/or against *Candida*. 25 The non-derivatized constructs with the highest antimicrobial activities as tested included XMP.627, XMP.628, XMP.629, XMP.656, XMP.679, XMP.760, XMP.764, XMP.776 and XMP.778. The derivatized constructs with the highest activities as tested included XMP.664 and XMP.767.

In other assays of LPS neutralization, exemplary constructs of the invention such as XMP.624, XMP.625, XMP.626, XMP.628 and XMP.629 showed activity in a RAW cell assay (substantially in accordance with for example, Example 7 of U.S. Patent No. 5,858,974, and Example 20D of U.S. Patent No. 5,652,332; other LPS assays include Examples 4, 20A, B, C, E, F and G, 25 and 26 of U.S. Patent No. 5,652,332).

Additional heparin binding and heparin neutralizing assays both *in vitro* and *in vivo* (including for example, Examples 6, 11, 17 and 21 of U.S. Patent No. 5,652,332), have been described for BPI protein products and are useful for testing peptide-based constructs of the invention.

Other peptide-based constructs are described in U.S. Application No. 09/344,541 and concurrently filed continuation-in-part U.S. Application No. \_\_\_\_\_ [“Derivative Compounds”, Attorney Docket No. 11045US02 (100-15 257.P1)] and the concurrently filed corresponding PCT Application No. \_\_\_\_\_ and are hereby incorporated by reference in their entirety. All U.S. patents, U.S. patent applications, International PCT Publications and references cited herein are hereby incorporated by reference in their entirety. Numerous modifications and variations of the above-described invention are expected to occur to those of skill in the art. Accordingly, only such limitations as appear in the appended claims should be placed thereon.

**WHAT IS CLAIMED IS:**

1. A peptide-based construct of 8-15 amino acid moieties in length having at least one of heparin binding, heparin neutralizing, endothelial cell proliferation inhibiting, or antiangiogenic properties comprising:

5 a sequence having the formula:

wherein,

10  $\alpha$  is a hydrophilic basic amino acid moiety that is any one of lysine, arginine, histidine, ornithine, diaminobutyric acid, citrulline, or para-amino phenylalanine;

15  $\beta$  is a hydrophilic neutral amino acid moiety that is any one of asparagine, glutamine, serine, threonine, tyrosine, hydroxyproline, or 7-hydroxy-tetrahydroisoquinoline carboxylic acid;

20  $\chi$  is a hydrophobic amino acid moiety that is any one of alanine, naphthylalanine, biphenylalanine, valine, leucine, isoleucine, proline, phenylalanine, tryptophan, methionine, glycine, cyclohexylalanine, amino-isobutyric acid, norvaline, norleucine, tert-leucine, tetrahydroisoquinoline carboxylic acid, pipecolic acid, phenylglycine, homophenylalanine, cyclohexylglycine, dehydroleucine, 2, 2-diethylglycine, 1-amino-1-cyclopentane carboxylic acid, 1-amino-1-cyclohexane carboxylic acid, amino-benzoic acid, amino-naphthoic acid,  $\gamma$ -amino butyric acid, beta-alanine, difluorophenylalanine, fluorophenylalanine, nipecotic acid,  $\alpha$ -aminobutyric acid, thienyl-alanine, or t-butyl-glycine; and

25 R is an amino acid moiety that is any one of  $-\chi$ ,  $-\chi-\alpha$ ,  $-\chi-\alpha-\chi$ ,  $\chi-\alpha-\chi-\beta$ ,  $-\chi-\alpha-\chi-\beta-\chi$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha-\chi$ ,  $-\chi-\alpha-\chi-\chi-\alpha-\chi$ ,  $-\text{NH}_2$ ,  $-\chi-\text{NH}_2$ ,  $-\chi-\alpha-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\beta-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha-\chi-\text{NH}_2$ , or  $-\chi-\alpha-\chi-\chi-\alpha-\chi-\text{NH}_2$ .

30

2. A composition of 8-15 amino acid moieties consecutively linked by peptide bonds, said composition having one or more heparin binding properties and comprising a sequence of the formula:

5 wherein R<sub>3</sub> is any one of K, K(naph-A), K(naph-A)K, K(naph-A)KG, K(naph-A)KGS, K(naph-A)KGSI, K(naph-A)KGSIK or K(naph-A)KGSIKI; or wherein the carboxyl terminal group is amidated or nonamidated, and optionally, at least one conservative substitution of amino acid moieties.

10 3. The composition of claim 2 comprising two or more conservative substitutions of amino acid moieties.

4. The construct of claim 1 or composition of claim 2 having heparin neutralizing properties.

15 5. The construct of claim 1 or composition of claim 2 having endothelial cell proliferation inhibiting properties.

20 6. The construct of claim 1 or composition of claim 2 having anti-angiogenic properties.

7. The construct or composition of any one of claims 1 to 6 wherein the first two amino-terminal amino acid moieties are D-amino acid moieties and the last two carboxy-terminal amino acid moieties are D-amino acid moieties.

25 8. A method of neutralizing heparin in a mammal that has been administered an exogenous heparin compound comprising the step of administering to said mammal an amount of the construct of claim 1 or composition of claim 2 effective to neutralize the anticoagulant effect of the exogenous heparin compound.

30 9. The method of claim 8 wherein the clotting time of said mammal is returned to normal.

10. A method of inhibiting endothelial cell proliferation in a mammal in need thereof comprising the step of administering to said mammal an amount of the construct of claim 1 or composition of claim 2 effective to inhibit endothelial cell proliferation.

5

11. A method of inhibiting angiogenesis in a mammal in need thereof comprising the step of administering to said mammal an amount of the construct of claim 1 or composition of claim 2 effective to inhibit angiogenesis.

10

12. The method of claim 11 wherein said angiogenesis is in the eye.

13. A method of treating a mammal suffering from a disorder involving angiogenesis comprising the step of administering to said mammal an amount of the construct of claim 1 or composition of claim 2 effective to inhibit angiogenesis.

15

14. The method of claim 13 wherein said disorder involving angiogenesis is a chronic inflammatory disease.

20

15. The method of claim 14 wherein said chronic inflammatory disease is rheumatoid or reactive arthritis.

16. The method of claim 13 wherein said disorder involving angiogenesis is proliferation or metastasis of tumor cells.

25

17. A derivatized peptide-based construct of 8-15 amino acid moieties in length having heparin binding, heparin neutralizing, endothelial cell proliferation inhibiting, or antiangiogenic properties comprising:

a sequence having the formula:

30

wherein,

$\alpha$  is a hydrophilic basic amino acid moiety that is any one of lysine, arginine, histidine, ornithine, diaminobutyric acid, citrulline, or para-amino phenylalanine;

$\beta$  is a hydrophilic neutral amino acid moiety that is any one of asparagine, glutamine, serine, threonine, tyrosine, hydroxyproline, or 7-hydroxy-tetrahydroisoquinoline carboxylic acid;

$\chi$  is a hydrophobic amino acid moiety that is any one of alanine, naphthylalanine, biphenylalanine, valine, leucine, isoleucine, proline, phenylalanine, tryptophan, methionine, glycine, cyclohexylalanine, amino-isobutyric acid, norvaline, norleucine, tert-leucine, tetrahydroisoquinoline carboxylic acid, pipecolic acid, phenylglycine, homophenylalanine, cyclohexylglycine, dehydroleucine, 2, 2-diethylglycine, 1-amino-1-cyclopentane carboxylic acid, 1-amino-1-cyclohexane carboxylic acid, amino-benzoic acid, amino-naphthoic acid,  $\gamma$ -amino butyric acid, beta-alanine, difluorophenylalanine, fluorophenylalanine, nipecotic acid,  $\alpha$ -aminobutyric acid, thienyl-alanine, or t-butyl-glycine;

R is an amino acid moiety that is any one of  $-\chi$ ,  $-\chi-\alpha$ ,  $-\chi-\alpha-\chi$ ,  $\chi-\alpha-\chi-\beta$ ,  $-\chi-\alpha-\chi-\beta-\chi$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha-\chi$ ,  $-\chi-\alpha-\chi-\chi-\alpha-\chi$ ,  $-\text{NH}_2$ ,  $-\chi-\text{NH}_2$ ,  $-\chi-\alpha-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha-\text{NH}_2$ ,  $-\chi-\alpha-\chi-\beta-\chi-\alpha-\chi-\text{NH}_2$ , or  $-\chi-\alpha-\chi-\chi-\alpha-\chi-\text{NH}_2$ ; and

wherein,

R<sub>1</sub> is any one of R<sub>2</sub>—CH<sub>2</sub>—, R<sub>2</sub>—CH<sub>2</sub>—CO—, R<sub>2</sub>—CO—, R<sub>2</sub>—SO<sub>y</sub>—, or R<sub>2</sub>—PO<sub>z</sub>—;

wherein,

$$y=0-3,$$

$$z=1-4;$$

R<sub>2</sub> is a hydrophobic moiety that is any one of a cyclic molecule having at least 3 carbon atoms, a heterocyclic molecule having at least 3 atoms, a functionalized cyclic molecule having at least 3 carbon atoms, or a functionalized heterocyclic molecule having at least 3 atoms.

18. A composition of 8-15 amino acid moieties consecutively linked by peptide bonds, said composition having one or more heparin binding properties and comprising a sequence of the formula:

$R_1$  is any one of  $R_2-CH_2-$ ,  $R_2-CH_2-CO-$ ,  $R_2-CO-$ ,  $R_2-SO_y-$ , or  
 $R_2-PO_2-$ ;

wherein,

$$y=0-3,$$

10                     $z=1-4;$

$R_2$  is a hydrophobic moiety that is any one of a cyclic molecule having at least 3 carbon atoms, a heterocyclic molecule having at least 3 atoms, a functionalized cyclic molecule having at least 3 carbon atoms, or a functionalized heterocyclic molecule having at least three atoms;

15                    wherein  $R_3$  is any one of K, K(naph-A), K(naph-A)K, K(naph-A)KG, K(naph-A)KGS, K(naph-A)KGSI, K(naph-A)KGSIK or K(naph-A)KGSIKI;

wherein the carboxyl terminal group is amidated or nonamidated,

and, optionally, comprising at least one conservative substitution of amino acid moieties.

20

19. The composition of claim 18 comprising two or more conservative substitutions of amino acid moieties.

25

20. The construct of claim 17 or composition of claim 18 having heparin

neutralizing properties.

21. The construct of claim 17 or composition of claim 18 having endothelial cell proliferation inhibiting properties.

30

22. The construct of claim 17 or composition of claim 18 having anti-angiogenic properties.

23. The construct or composition of any one of claims 17 to 22 wherein the first two amino-terminal amino acid moieties are D-amino acid moieties and the last two carboxy-terminal amino acid moieties are D-amino acid moieties.

5 24. A method of neutralizing heparin in a mammal that has been administered an exogenous heparin compound comprising the step of administering to said mammal an amount of the construct of claim 17 or composition of claim 18 effective to neutralize the anticoagulant effect of the exogenous heparin compound.

10 25. The method of claim 24 wherein the clotting time of said mammal is returned to normal.

15 26. A method of inhibiting endothelial cell proliferation in a mammal in need thereof comprising the step of administering to said mammal an amount of the construct of claim 17 or composition of claim 18 effective to inhibit endothelial cell proliferation.

20 27. A method of inhibiting angiogenesis in a mammal in need thereof comprising the step of administering to said mammal an amount of the construct of claim 17 or composition of claim 18 effective to inhibit angiogenesis.

28. The method of claim 27 wherein said angiogenesis is in the eye.

25 29. A method of treating a mammal suffering from a disorder involving angiogenesis comprising the step of administering to said mammal an amount of the construct of claim 17 or composition of claim 18 effective to inhibit angiogenesis.

30 30. The method of claim 29 wherein said disorder involving angiogenesis is a chronic inflammatory disease.

31. The method of claim 30 wherein said chronic inflammatory disease is rheumatoid or reactive arthritis.

32. The method of claim 29 wherein said disorder involving angiogenesis is proliferation or metastasis of tumor cells.

33. The construct of claim 17 or composition of claim 18, wherein said R<sub>2</sub> is a hydrophobic moiety that is any one of (a) an optionally substituted carbocyclic ring, saturated or partially or fully unsaturated containing 3 to 8, preferably 5 or 6, carbon atoms; (b) an optionally substituted heterocyclic ring, saturated or partially or fully unsaturated, containing 3 to 8, preferably 5 or 6, atoms, wherein at least one atom is a heteroatom that is any one of oxygen, nitrogen, or sulfur; or (c) an optionally substituted bicyclic ring

wherein the fused rings A and B, independently, are a 5- or 6-membered ring, saturated or partially or fully unsaturated, and comprise carbon atoms and optionally one to three heteroatoms selected from oxygen, sulfur, or nitrogen; wherein if there is more than one heteroatom, each may be the same or different.

34. The construct of claim 17 or composition of claim 18, wherein said R<sub>2</sub> is a hydrophobic moiety that is any one of biotin, 2-biphenylene, 2-anthraquinone, 2-benzofuran, 2-indole, 1-isoquinoline, hydroxyphenyl, 2-quinoline, 1-[3-(3,4-dihydroxycinnamoyl)-1,3,4,5-tetrahydroxycyclohexyl], 1-(3,5-dichloro-2-hydroxyphenyl), 1-(3,5-diiodo-2-hydroxyphenyl), 1-(3,5-dinitro-2-hydroxyphenyl), 1-(4-azido-2-hydroxyphenyl), 4-biphenyl, 2-biphenyl, 1-naphthyl, 2-naphthyl, 3-amino-2-naphthyl, 3-chloro-2-nitrophenyl, 3,4-dihydroxyphenyl, 3,4,5-trihydroxyphenyl, 2-chloro-3-nitrophenyl, 5-azido-2-nitrophenyl, 3-amino-2-pyrazyl, 2-benzyloxycarbonyl-ethyl, 2-thienyl, 2-(3,4-dihydroxyphenyl)ethylene, 5-bromo-3-indolemethylene, 2-(4-hydroxy-3-methoxyphenyl)ethylene, 2-(3-chlorophenyl)ethylene, 2-pyrazyl, 4-imidazolyl, 2-imino-1-imidazolidyl, pyridyl, 3-piperidyl, 4-piperidyl, fluorescein, 2-(4-amino-3,5,6-trichloro-pyridyl), 3-(2-chloro-6-fluorophenyl)-5-methylisoxazolyl, or 4-azido-phenyl.
